CARDCO's new DIGI-CAM™ is a video digitizer that lets you transform just about anything you can shoot with a video camera into a black-and-white digital image. And, with your Commodore 64™, you can make pictures of that image.

DIGI-CAM™ comes complete with a black-and-white video camera, a digitizer, and software. It's the most comprehensive package at the most competitive price around. And it's a CARDCO quality product.

FOCUS...SHOOT...STORE... AND PRINT!

DIGI-CAM™ is incredibly easy to use. Simply focus the video camera on your subject, view the shot on your Commodore 64™ monitor, store the shot on CARDCO's DIGI-CAM™ software ... and print out. You can enhance or change the on-screen

image — or combine it with text — because a version of CARDCO's Paint Now/Graph Now software is built in ... at no extra cost!

Make T-shirts for your friends**, Christmas cards and birth announcements ... maps, graphs, photos, security i.d.'s ... use it for business or pure pleasure. Plus, you can transfer still images via modem to other Commodore™ computers ... and share your shots! (Soon to

be compatible with Apple and IBM.)

VIEW FROM THE BRIDGE

Before we talk about what's in this issue of *Ahoy!*, let's talk about what's *not* in it. Two other Commodore magazines, you may have noticed, ran reviews of the Commodore 128 Personal Computer in their June issues. Why did *Ahoy!*, which always leads the pack in announcing and reviewing new products, allow itself to be scooped in this singularly important instance?

Tina Turner summed it up best when she said, "We never ever do nothing nice and easy." We weren't about to prepare a feature article on the 128 based on an afternoon's experimentation with the machine at Commodore's headquarters, as our two competitors did. We published our surface analysis of the 128 in April; not until Commodore shipped us a model of our own did Morton Kvelson sit down for a several-week round of testing the machine inside and out. The first pieces based on that research appear in the August *Ahoy!* As anxious as you are to read the definitive review of the Commodore 128, we know a month is a long time to wait. But we've packed the July *Ahoy!* full of programs and features that should help make that month pass quickly:

- The graphics theme begun last issue continues with Part II of Roger Macomber's tutorial on *Screen Dumping on the Commodore 64*, providing an onscreen Etch-a-Sketch (turn to page 73). Then, Morton Kvelson takes an extended look at *The Print Shop*, certainly one of the most popular Commo-

dore programs of all time. Morton and Michael Beutjer (author of last issue's *Quad-Print*) each contribute an enhancement utility that will help users get even more out of the program. (Turn to page 50.) Finally, our *Art Gallery* debuts this issue, with some of the first submissions of reader-generated graphics. (Turn to page 54.)

- Once again, Orson Scott Card's *Creating Your Own Games on the VIC and 64* transcends the genre of computer games—and published software. *Trio Allegretto* supplies machine language routines that you can imbed in your game program to play music that the program loads into BASIC strings, at any speed, on the VIC or 64. (Turn to page 18.)

- They used to call it ROM burning, back when ROMs were programmed by burning open a fusible link. The days of burning ROMs have vanished, along with the fusible links by which they were programmed; but the home user can still place his programs in Permanent Read Only Memory. In *PROM Programming Made Easy*, Morton the K shows 64 and VIC users how to do that at surprisingly low cost. (Turn to page 27.)

- Bob Lloret returns to *Ahoy!*'s program pages with *Lucky Lottery* for the 64. It's as valuable a system as you'll find anywhere for picking the winning numbers in your state lottery—which means, completely worthless. But you'll have fun predicting winners based on past weeks' results. (Turn to page 53.)

- Moving up to the pseudo-scientific, Bob Spirk's *Script Analysis* will allow 64 users to prepare a character profile based on a subject's handwriting sample. (Turn to page 17.) Bob also contributes *The Wizard of Im*, a machine language game for the 64. While the game's format is nothing new, what Bob does with a familiar theme is...magic! (Turn to page 47.)

- *Printat* by Simon Edgeworth simulates the cursor-control command of the same name found in some advanced versions of BASIC. (Turn to page 45.)

- William V. Braun's *Auto-Append* will allow VIC and 64 users to merge programs instantly. (Turn to page 62.)

- You've heard that it can be cheaper to lease a new car than buy one—but who can assess all the variables involved and make a determination? You can—with Gil Ragan's *Autos: Leasing v. Buying* for the C-64. (Turn to page 75.)

- Have Dale Rupert and Mark Andrews got big plans for you this month! In the *Rupert Report* on *Speeding Pixels*, you and Dale will develop a pair of assembly language routines that will speed up the manipulation of the 64,000 pixels in hires bit mapped graphics on the 64. (Turn to page 37.) In *Commodore Roots*, Mark Andrews steps you up to *Writing and Running an Assembly Language Program*. (Turn to page 77.)

At this point, we'll draw an exhausted breath and let you discover the rest of the programs and features in the July *Ahoy!* for yourself. (Didn't we tell you we'd make you forget all about next month's feature on the 128?)

An open letter to the readers of Ahoy Magazine Vincent Kurek President: The Ennon Corporation

My purpose in writing is to ask you to join me in shaping the future of the new and most unusual field in computer technology today: Artificial Intelligence.

This incredible power and spectacular creative potential are available to you, for your computer right now. However, there is an alarming possibility that such amazing technology which you have every right to, may not be available to you other than through this offer.

This is unfortunate but somewhat understandable due to the way technology is created. You see, only the business oriented corporation can finance research. It therefore is in a position to dictate immediate research goals. These goals are increasing profits through more efficient production. While valid, they are merely creative and do absolutely nothing to foster exploration in new applications. The result: technology is never used to its fullest potential. But what's worst of all is that these competitive corporations have absolutely no desire to share technology with each other, let alone with you. So, they don't. As a result, the infinitesimal amount of technology that finally trickles down to you is:

- A. So expensive you are prohibited from procuring it
- B. Shamefully inferior to the real thing

remember...you can buy high-tech consumer goods, but never the technology that creates it.

This same situation confronts you in the new Artificial Intelligence field, but with a difference:

There is no true Artificial Intelligence for the home computer user! The few programs claiming to be Artificial Intelligence are really simulators. They are not the real thing. Possessing a mere token of the power and versatility, simulators are clearly not worth their expensive price.

I have tried repeatedly to convince my colleagues that it is in their best interest to release genuine Artificial Intelligence to the general public. The refinement, modification and adaptation as individuals create new applications would improve Artificial Intelligence tremendously. This would benefit everyone in the long run.

I have met with little success. Apparently, it seems that immediate corporate profit is more important than sharing technology with the public. Therefore, the Ennon Corporation stands alone in offering superior Artificial Intelligence programming directly to the home computer enthusiast.

Announcing AN-83: The "Thinking" Program

Believe me when I say AN-83 is the real thing. It is a true "thinking" program that receives an initial "knowledge base" from a data file read when AN-83 is started. Using inductive and deductive logical analysis, this amazing program deduces everything from that data and adds it to its memory. Conversing with you, AN-83 adds and combines with facts already known. It generates new conclusions not explicitly contained in its original knowledge base—just like your own thinking process! The result: it knows considerably more than the specific facts given to it.

AN-83 can also think about anything. It is virtually unlimited in its application. Think of your possibilities. The potential is limitless. In the right hands, AN-83 would revolutionize the adventure, strategy and other smart game-playing programs to say nothing of classic arcade games. On the other hand, AN-83 could be one of the most powerful business analysts available to the home computer.

FREE SOFTWARE

In addition, you will be receiving free, Eliza—the most amazing conversational A.I. program to date. Run this for your friends and jaws will drop with amazement. Eliza's responses are so human, it's uncanny. An entertaining program, Eliza will answer once and for all the question: What can your computer do?

How to Learn Artificial Intelligence

You can be creative. Experiment and modify to fit your personal use because AN-83 and Eliza both possess source code in basic, the most popular easy to use language for the micro. Their extensive, easy to understand commands walk you through the source code

step by step. It's surprisingly simple. Even the beginner can understand the "How and Why of A.I."

A Fantastic Savings

The real profit to Ennon Corporation will be your participation in the future of Artificial Intelligence. Therefore, I am pleased to say nobody will miss this chance because they could not afford it. AN-83 is priced to cover just a fraction of its research and developmental costs.

The "Thinking" Program AN-83 is just \$21.57. What's more, the astounding Eliza is yours absolutely free.

I guess it's obvious that I want you to participate in the future of Artificial Intelligence. Forgive my excitement and enthusiasm but I just know you are going to be very happy and impressed that such things could be done with your computer. You just won't believe it. Please take this opportunity now. Simply fill out your coupon below and mail today. Don't miss out. It's such a wonderful future of discovery and excitement that awaits you.

With very best of wishes,

Vincent Kurek

NEW GAME RELEASES

Three for the C-64 from SSI:

Designed for the avid strategist, *Operation Market Garden* simulates Montgomery's 1944 paratroop raid on occupied Holland. As leader of the largest daylight airborne and surface operation in history, you coordinate airstrikes, engage in combat, blow up and rebuild bridges, and initiate cross-river assaults with airborne/en-

emy. An onscreen map shows buildings, hedges, walls, doors, windows, and the location of your soldiers. Price: \$59.95.

Newly adapted for the 64, *Cartels and Cutthroats* puts you in charge of a manufacturing plant. Based on newswires, market summaries, profit and loss statements, and memos from department heads, you must make executive decisions. Ulcer-inducers include inflation and high interest rates, labor demands, and government intervention. Price is \$39.95.

EDUCATIONAL RELEASES

Temperature Lab is the first release in Hayden Software's science laboratory series, designed to transform a home or classroom into a science research center. The program, which enables students to conduct experiments that illustrate classic scientific phenomena, includes an electronic thermometer that plugs into the 64, enabling students to record temperatures and see them displayed on the screen. An Experimenter's Guide provides step-by-step instructions for experiments. Price: \$99.95.

Soon to follow is *Light Lab*, focusing on various visible light concepts like foot-candles, solar eclipses, and sunsets.

Hayden Software Company, Inc., 600 Suffolk Street, Lowell, MA 01854 (phone: 617-937-0200).

STORY-WRITING SOFTWARE

Build a Book About You allows an adult to incorporate the name, address, pet, school, and friends of a child into a 32-page hardcover storybook. Available titles are *The Mystery of Scented Mountain*, *The Holiday Dragon*, *Adventures on the Riddle Planet*, and *The Greatest Circus Story Ever Told* (all written for children 2-12 years old). Each kit is \$39.95; refill kits are \$19.95.

Scarborough Systems, Inc., 55 S. Broadway, Tarrytown, NY 10591 (phone: 1-800-882-8222).

Two additions to Woodbury Software's *PlayWriter* lineup of home-makeable hardcover novels, designed for advanced young users and adults (the earlier releases *Tales of Me* and *Adventures in Space* were recommended for children aged 7-14):

Mystery! allows the writer to choose and describe his sleuth, determine method and motive of murder, and create his own cast of characters. If you want to be surprised, the program will pick the murderer for you.

Castles & Creatures lets you construct a fantasy world replete with dragons, knights, princes and princesses, and sorcerers.

All four *PlayWriter* titles sell for \$39.95 and include disk, color stickers, and full-page illustrations.

Woodbury, along with Grolier Electronic Publishing, will sponsor a novel writing contest for students—using *PlayWriter* software, naturally. SIGHT & SOUND ENHANCEMENTS

Sight & Sound has added bonus programs to their *Kawasaki Rhythm Rocker* and *Incredible Musical Keyboard* disks:

Rhythm Rocker now contains a new notation system that will display everything the user plays on the screen, a score printer, auto-correct, and the ability to change voices while playing, transpose to any of 12 keys, and use a multitude of specially created effects. Price remains at \$34.95; current owners can upgrade for \$15.00.

Incredible Musical Keyboard now allows for recording songs using up to three voices and sports a new notation and graphics program and five background accompaniments. Price

is \$39.95; upgrade is \$7.00.

Sight & Sound Music Software, Inc., P.O. Box 27, Dept. R2D2, New Berlin, WI 53151 (phone: 414-784-5850).

VIC-TALKER

Long overshadowed by that other Commodore computer, the VIC 20 can now make some noise with VIC-Talker. Using advanced English pronunciation rules and a user-expandable exception memory, Talker will supposedly provide unlimited vocabulary translation of text to synthesized speech. The cartridge will operate immediately upon power-up with an unexpanded VIC 20. The user can vary pitch to synthesize a singing voice or emphasize statements, questions, and exclamations.

Priced at \$89.00 plus shipping and handling, VIC-Talker will be shipped within four weeks of receipt of order by Talktronics, Inc., 27341 Eastridge Drive, El Toro, CA 92630 (phone: 714-768-4220).

**MICRO
MAIL**

"Micro Mail" is the first dedicated and powerful mailing list designed exclusively for your Commodore 64. It's completely menu driven and loaded with prompts. Some say you don't need instructions, but we included them anyway. "Micro Mail" will add, delete, edit, search, display, print, and sort all your records in a matter of seconds. If you have a need to store and retrieve information, don't be without "Micro Mail."

"Micro Checkbook" is bound to be the standard for other programs to live up to. Like "Micro Mail," it is dedicated and very powerful. It's completely menu driven and very user friendly. "Micro Checkbook" will add, delete, edit, search, display, print, and sort all records in a matter of seconds as well as store all tax information and balance your statement every month. If your checkbook is a problem (and whose isn't?), "Micro Checkbook" is your permanent cure.

ERRATA

Because *DSKDU* (May '85) was written on a VIC 20, with its eight extra characters per line, line 2220 was too long to enter on the 64. C-64 users can amend this problem as follows:

```
2220 BY=P+L*4+C/2:HX=CAND1:H1$(0)=HX$(D%
(BY)/16):H1$(1)=HX$(D%(BY)AND15)
2221 C1=INT(C*1.5)
```

In the first installment of *Commodore Roots* (April '85), on page 52, it is stated that in hexadecimal, the letters A-F represent the decimal numbers 11-16 respectively. That should be 10-15. Thanks to Michael R. Whitner of Toledo, Ohio for alerting us to the error.

On page 35 of the May '85 issue, the phone number of Epyx is listed incorrectly. The correct number is 408-745-0700.

The *Font Factory*, described on page 7 of our June '85 issue, is available from Micro-W. Distributing, Inc., 1342B Rte. 23, Butler, NJ 07405 (phone: 201-838-9027).

Script Analysis

FOR THE C-64

By Bob Spirko

It's happened to all of us at one time or another. We see someone at a distance and although we cannot make out his features, we recognize him by his walk or his gestures. His body language discloses his personality. The hand, a part of the body, also reveals a person's character, but it has a singular difference—it leaves a tracing of its movement on paper. This tracing can be analyzed to determine personality, the science of which is called handwriting analysis, or graphology. A detailed analysis can take several hours to prepare, but a general analysis can be made simply and easily using *Script Analysis*. More important, you don't have to know a thing about handwriting analysis to use it.

The program will not analyze handwriting, but it will interpret your observations. Don't worry if you don't know what to look for. The program is rife with instructions and examples. I've made extensive use of character graphics to guide you along. All you do is answer the questions and the computer will do the rest.

While the analysis is general and less accurate than an indepth analysis done by a professional graphologist, it will provide you with a personality description of any sample of handwriting that you care to use. It was not feasible to incorporate the hundreds of characteristics that can be interpreted, so I chose a few dozen for their ease of recognition and general acceptance in graphology (opinions vary widely on some interpretations).

In the program, each handwriting characteristic is attributed words that describe personality traits. The program has a vocabulary of 74 words ranging from aesthetic to unreliable. The program compiles all the words or traits that appear in the script, but in the analysis it only lists those that appear more than once. Contradictions may turn up, but this does not necessarily mean the analysis is wrong. It is, for instance, possible to be both careful and careless. A person may be meticulous about writing a program while at the same time he allows his working space to degenerate into disarray!

The sample of handwriting should follow a few rules. For one thing, it must be written on a blank piece of paper; no guidelines may be used. Letter-sized paper is preferred. As for the implement, ball-point pen or pencil is best since pressure cannot be interpreted from a felt-tip pen. Probably the best samples to analyze are from letters, since they are usually written spontaneously.

With your sample on hand, run the program. You'll

first be asked for the filename. Next you'll be asked if it is a new file or if it is to be LOADED. If you press N you'll then be asked if the sample was written by a lefthanded or righthanded person. Answer this and you'll be given the first of fifteen categories, slant. Follow the instructions and then choose the appropriate handwriting characteristic. You'll go through each category this way. Once you've completed all of them, you'll be given a list of the handwriting characteristics that you chose, followed by two lists of personality traits. Dominant Traits are traits that have appeared three or more times, whereas Other Traits have occurred only twice. From there you have the option of sending the file to printer, disk, or tape; or you can elect to begin another analysis. □

WORD RUNNER

Word Processing System by N-Systems

Perfect for the first-time user —

- No printer or page set-up required for standard format. Just enter a file name and start typing.
- All editing is done in "normal" text entry mode. No special insert or edit modes.
- Single-keystroke commands—no complicated command syntax.
- Fast, efficient machine language operation.

For the advanced user too —

- Move up to six thousand characters of text at one time—even between documents.
- Full screen editing.
- Global Search—Search and Replace.
- Built-in commands for italic, underline, bold-face, double width, superscript and subscript.
- Automatic page numbering.
- Display each page on the screen and edit before printing, or print entire document in continuous stream
- Document length may be up to entire disk.

Trio Allegretto

FOR VIC AND 64

Machine language routines
that let your VIC or 64
play three-part harmonies
at any speed.

CREATING YOUR OWN GAMES ON THE VIC AND 64

When you sit down at the piano, you don't have to be an expert musician. You hit a key and music comes out. If you hit too many keys, and you don't know what you're doing, you can turn it into noise pretty quickly. But the problem then is that you can make sounds too *easily*; you have to practice to get your own fingers under control.

That's because the piano is designed to do one thing and do it well. It translates the pressure of your fingers on the keys into strokes of a hammer against carefully tuned strings. All you have to do is figure out which keys to press.

"Oh, is that *all*, Mr. Card? Then you'll love to sit right down and play this little Chopin Nocturne. And when you've done that, I've got a Debussy, a Satie, and a charming little Mozart piece you'll be glad to diddle out for us."

No, I'm not saying it's easy. I'm just saying it's a heck of a lot easier than if you had to hold five or six hammers and hit the strings yourself!

Now, the VIC and Commodore 64 are not as conveniently designed as a piano. For one thing, the keyboard is designed with alphabets, not harmonics, in mind. For another, the BASIC language completely ignores music in both computers—you have to use machine language or POKES to produce the sounds. Even more limiting is the fact that you can never have more than three musical notes playing at the same time in either machine.

So you'll be delighted to know that this issue of *Ahoy!* includes machine language routines that you can embed in your own programs to play music that your program loads into BASIC strings. Mind you, unless you want to play nothing but the three songs I've included here as examples, you're going to have to do some calculating, and to make it work with your own program you'll have to do some programming, too. But these routines will allow you to play music as fast as you want to—too fast to hear, in fact—and using all three voices on either computer.

THE SHAPE OF THE SOUND

Even more important is the fact that both programs let you design the *shape* of the sound. This was fairly easy on the 64, since the SID chip was designed to allow sound "shaping;" it was much trickier on the VIC, and the results were far less effective, because the computer wasn't designed with sound shapes in mind.

Before you can effectively use these routines, though, you need to know something about sound.

The sound produced by a musical instrument does not have the same volume all the way through the note. For instance, a gong begins very loudly and then slowly fades away; a bowed violin begins much less sharply, but sustains its tone fairly loudly while it is still being played. A piano sound begins sharply, fades off rapidly to a lower sustain level, until the key or the pedal is released; then the note continues to "ring" until it fades to nothing.

The way that the volume varies during the sounding of the note is called the "sound envelope." The speed at which the sound rises from silence to the loudest volume is the "attack." The speed at which the sound then falls off after the attack is called the "decay." The volume that the sound stays at as long as the note is held is called the "sustain." And the speed at which the sound drops back to silence after the note stops being played is called the "release."

Notice that attack, decay, and release are all *speeds*—how fast the volume changes from soft to loud or loud to soft. Sustain is a volume control. The initial attack always takes the note to the maximum volume; the sustain is the fraction of that volume that the note has during the time it is held.

DOING ENVELOPES ON THE 64

A computer doesn't have to fuss with sound envelopes. You can simply switch on the note and it will continue to play that note until you switch it off. However, this makes for boring, mechanical sounding music.

So the designers of the Commodore 64 put the sound envelope entirely within your control. Each of the three musical voices has a separately controlled sound envelope, so that you can have the illusion of three different musical instruments playing at once.

Each of the three voices has four four-bit envelope control registers. Each four-bit register controls one of the envelope parameters—attack, decay, sustain, or release. Since four bits can hold any number from 0 to 15, the attack, decay, sustain, and release are all expressed as numbers from 0 to 15.

In the case of attack, decay, and release, the number represents speed: 0 is the fastest, and 15 the slowest. In the case of sustain, the number represents volume: 0 is silence, and 15 is maximum volume.

These four four-bit registers use up a total of 16 bits. Since they are read from ordinary eight-bit memory locations, those 16 bits are carried in only two memory locations for each voice. The first byte of each pair controls attack and decay; the second byte controls sustain and release. For voice 1, the registers are at locations 54277 and 54278; for voice 2, 54284 and 54285; for voice 3, 54291 and 54292.

If you POKE (or, in machine language, STA) these values into those locations, you have to change them a bit. Let's say you have a fairly sharp attack of 2, a gentle decay of 7, a low sustain of 5, and a slow release of 14,

and you want this envelope to be played by voice 1. First, you multiply the attack by 16 ($16 \times 2 = 32$) and then add it or OR it (in ML, ORA it) with the decay value of 7. The resulting number, 39, is POKEd (or STAed) into location 54277. Then you multiply the sustain by 16 ($16 \times 5 = 80$) and add it or OR it with the release value of 14. The resulting number, 94, is POKEd (or STAed) into location 54278.

Once that envelope is set for voice 1, every new note that you "gate" on—POKE 54276, (PEEK(54276) AND 254) OR 1—will use that same attack, decay, and sustain, and will keep playing the note at the sustain volume until you "gate" it off—POKE 54276, PEEK(54276) AND 254.

The 64 sound program, *Song Maker*, does all the calculating for you. All you have to do is set the individual attack, decay, sustain, and release values for each of the three voices in lines 9010, 9020, 9030, and 9040. AK% () is set to the attack for each voice; DY% () is set to the decay for each voice; and so on.

FAKING IT ON THE VIC

The VIC does *not* have separate envelope controls for the three sound generators, so the machine language routine has to fake the effect by changing the volume control at location 36879. Because all three voices are controlled by the same volume instruction, the three voices all have to have the same envelope. This does not mean, however, that they will *sound* the same. This is because

each of the three voices has a different waveform, or tone quality (see below).

The *VIC Music* program has two sound routines. The BASIC statements from line 9010 to 9039 put the sound envelope routine in memory locations 663 to 767. The machine language commands contained in lines 9011, 9016, and 9025 contain subroutines that execute delays for varying lengths of time, ranging from milliseconds to the duration of an individual note.

The rest of the machine language routine executes as follows:

Line 9030: this subroutine is used constantly to set the volume register to the desired level. It reads the old value at location 36878, ANDs it with 240 to wipe out the old volume level, ORAs it with the current volume (which is maintained by another routine in location 150), and STAs it at 36878.

(If you aren't familiar with how this is done in machine language, here is a detailed explanation of each number in the routine:

173 is the command LDA (absolute), which means "pick up into the accumulator whatever number is found at the memory location described in the next two bytes."

14 is the low byte of the address of the memory location.

144 is the high byte, or page number, of the address. To find the decimal equivalent, you would use $144 \times 156 + 14$, which is 36878. To go the other direction, from 36878 to low byte (LB), high byte (HB) form, you would use $HB = \text{INT}(36878/256)$; $LB = 36878 - (256 \times HB)$.

41 is the machine language command AND (immediate), which means "perform a bitwise AND operation between the number now in the accumulator and the number that immediately follows this instruction."

240 is the next number. It is ANDed with the number now in the accumulator, which we picked up a moment ago from location 36878. (This operation has the effect of zeroing out the volume-control bits, without disturbing the four bits at that location that have nothing to do with sound.) The result of this AND operation is put back in the accumulator.

5 is the command ORA (zero page), which means "perform a bitwise OR operation between the number now in the accumulator and the number found at the zero-page location described by the next byte."

150 is the address of the location where other routines store the number that they want used for the volume. Since the command 5 specified that this would be a zero-page address, the high byte of the address is assumed to be 0 and doesn't have to be stated. (This operation has the effect of combining the new volume value with the unchanged high byte of the original number at location 36878.) The result of this ORA operation is put back in the accumulator.

141 is the command STA (absolute), meaning "take the number in the accumulator and store it at the memory location specified by the next two bytes." It's the reverse of the LDA (absolute) command.

14 is the low byte again.

144 is, again, the high byte of address 36878.

96 is the command RTS, which means "return from this subroutine." The computer immediately jumps back to the next instruction after the JSR (address) instruction that invoked this subroutine in the first place.

For obvious reasons, we won't go into this kind of detail with the rest of the machine language routines included here.)

Line 9035: gradually bring the volume from 0 to 15, pausing between each increment of the volume for the amount of time specified by the attack value at location 659 (low byte 147, high byte 2).

Line 9036: pause for a moment at peak volume.

Line 9037: gradually bring the volume down from 15 to the sustain value specified at location 661, pausing between each decrement of the volume for the amount of time specified by the decay value at location 660.

Line 9038: wait for the amount of time specified by the duration value stored at zero-page location 149 (another routine puts this number here), combined with the basic tempo set at location 170.

Line 9039: gradually bring the volume down from the sustain value to 0, pausing between each decrement of the volume for the amount of time specified by the release value at location 662. The volume is now zero, the note is finished, so return from this routine to the program that called it.

This is perhaps more detail than you wanted, but it does show you how a sound envelope is created. None of this is necessary in the 64, because the SID chip does all this automatically (and, I might add, much more smoothly and effectively); furthermore, the volume of all the notes is changed at once.

THE QUALITY OF THE TONE

The quality of a sustained note comes from the shape of the sound wave. The ringing tone of a gong comes from a very different sound wave than the blare of a trumpet, and a violin makes an altogether different tone. Note

that this is not related to the sound envelope. A piano string, for instance, produces the same sound wave if it is plucked or if it is hammered, since the identical string is vibrating—but the sound envelope, the way the sound volume happens, is very different.

The 64 lets you choose one of three different musical waveforms for each voice. This waveform is selected by turning on bits at the control register (voice 1, location 54276; voice 2, 54283; voice 3, 54290). Remember that bit 0 of this location is the gate control—if bit 0 is a 1, the sound begins; if it is 0, the sound is released.

Bits 1 through 3 control sophisticated modifications of the tone quality that I won't attempt to explain here. (I've always found it somewhat harder to explain to other people things I don't understand myself.)

Bit 4 selects the *triangle* waveform. (Add 16 to the gate number.)

Bit 5 selects the *sawtooth* waveform. (Add 32 to the gate number.)

Bit 6 selects the *pulse* waveform. (Add 64 to the gate number.)

Bit 7 selects the *random noise* waveform. (Add 128 to the gate number. This is not used to produce melody or harmony.)

Now, I could spend a long time trying to tell you what the different waveforms sound like, but the truth is you'll only know what they sound like by trying them yourself.

Dreams CAN come true!

Back in June of 1983, Kelvin Lacy had a dream. He dreamed of creating one integrated program that would include a spreadsheet, business graphics and a database. A program with the power of Lotus 1-2-3. On the Commodore 64. People laughed! He had just finished OmniWriter, to be marketed by HESWARE. Ignoring the skeptical, he started on VIZASTAR.

Now, after 15 months, his dream has come true. VIZASTAR has a full-featured spreadsheet, as good as Multiplan. But much faster—faster than many spreadsheets on the IBM PC! It is written 100% in 6502 machine language code and is ALWAYS in memory. It is menu-driven, using the latest techniques in user-friendliness. It is compatible with virtually all printers and word processors. Up to 9 windows can be open simultaneously, anywhere. Remarkably, 10K of memory is available for spreadsheet use.

The database is equally impressive. Create file layouts by simply painting a picture of the layout on up to 9 screens, showing where a field starts and ends; VIZASTAR does the rest.

Imagine the power of a spreadsheet integrated with a database. Now add graphics — bar, line, and multi-color pie and 3-D "skyscraper" graphs. You could access a customer's profile in the database, transfer the data to the worksheet, and let it calculate discounts, sales tax etc. and then transfer the updated data back to the database. Open up a window anywhere and display a graph of your data, instantly. This integration is the key to VIZASTAR's power—the **first and only** program of this kind on the C-64. All commands can be automated, so you can "program" your own applications and run them with one keystroke.

Dealer Inquiries Welcome

In the 64 program, just change the values at line 9070 to select the waveform for each voice. You *can* combine the waveforms—that is, add both 32 and 64 or 16 and 32 or all three—but the result is less than thrilling.

However, you must choose at least *one* of the waveforms, or no sound will be produced. So the number you POKE in to gate the sound on will be *waveform + 1*; to gate the sound off, you can POKE a simple 0 or POKE in *waveform + 0*.

The pulse waveform is even more complicated than the others, because it can have different widths, which are controlled by the two memory locations just before the gate/waveform control register for each voice. The first of these bytes can use a value from 0 to 255; the second byte from 0 to 15.

WAVEFORM AND PITCH ON THE VIC

The VIC also allows you to choose different waveforms, but only by choosing the particular voice that has that waveform. When you choose to play voice 1, at 36874, you automatically get a low sawtooth waveform. Voice 2, at 36875, has a medium pulse waveform. Voice 3, at 36876, has a higher pulse waveform.

You use these registers to select the pitch—and to turn the voice on and off. The pitch is a value from 0 to 127. The pitches are exactly one octave different from voice to voice. That is, if you POKE the value 67 into register 36874, it will produce a C; if you POKE 67 into location 36875, it will also produce a C, but it will be an octave higher; a 67 stored in location 36876 will produce a C an octave higher still.

Whatever pitch you choose must be added to 128 to produce the actual sound, since 128 activates the on-off switch in each register. So to play that C in any of the three voices, you have to POKE *register, pitch + 128*.

The pitches are as follows:

7	67	97	112	C (B-sharp)
15	71	99	113	D-flat (C-sharp)
19	73	100		D
23	75	101		E-flat (D-sharp)
31	79	103		E (F-flat)
35	81	104		F (E-sharp)
39	84	105		G-flat (F-sharp)
47	87	107		G
51	89	108		A-flat (G-sharp)
55	91	109		A
59	93	110		B-flat (A-sharp)
63	95	111		B (C-flat)

To play each note, add it to 128 and POKE it into the register of your choice. To turn off the note, POKE a 0 into the same register.

HOW TO PUT MELODIES INTO THE 64

The program *Song Maker* uses exactly the same system of entering melodies in last month's program. To review briefly, the music is entered in strings starting at line 9500. The MD\$() string contains the duration of each note of the phrase, expressed as a number from 0 to 9. (You can determine the actual length of each duration value at lines 9100-9105.)

The ME\$() string contains the pitches for each note

Make Your Home Secure and Energywise ... with Genesis Home Control Products

At Genesis Computer we produce a complete line of home security and energy management products. They combine with your Commodore 64 to make your home safer and more energy efficient while increasing your personal convenience.

The Genesis VIconroller allows you to control up to 256 lights and appliances throughout your home using standard BSR receiver modules. With the included software, you can create daily and weekly control schedules.

Your system can be expanded by adding Genesis' COMsense input device, Super Schedule Plus software, and available sensors. Commands can then be issued in response to on/off inputs such as the opening of a door or analog inputs such as a change in light level. By adding COMclock, a crystal controlled clock/calendar, your system will have an accurate, battery backed-up time base. COMclock's Autoboot ROM acts as a failsafe restart for the system in the event of a power failure.

Sold separately the VIconroller, COMsense and COMclock sell for \$69.95 each and the Super Schedule Plus software sells for \$19.95. All four products are available together in our HOME CONTROL PACKAGE for only \$199.95.

in the phrase, expressed as alphabetic characters from A to G. These correspond exactly to the notes of the musical scale. To "sharp" a note, press SHIFT and the desired letter (C-sharp is SHIFT-C); to "flat" a note, press COMMODE and the desired letter (B-flat is COMMODE-B). To silence the voice (a musical rest or tacet), enter the @ symbol.

The MV\$() string selects which octave the note should be played in. It is a value from 0 to 6. You only need to enter a number when the octave *changes*; as long as the melody is in the same octave, just enter a space. *All the strings for the same phrase must be exactly the same length.*

The program *Summertime* shows all the lines that need to be changed to enter a different melody. Once you have typed in and saved *Song Maker*, delete all the lines between 9500 and 9890 and then type in all the lines shown with *Summertime*. The program will now play a different melody with different waveforms and envelopes. With this song, all three voices play the same pitch every time, but with different waveforms and envelopes; the combination can be surprisingly effective.

The *Song Maker* program's chief value is that it translates standard musical notes to the numeric form the 64 can use. However, it is very time-consuming during the setup. The program provides three ways for you to get the pitch value to use directly in the program that you're creating.

First, the program will display each note's duration and pitch values on the screen, if you select the P option (press N to stop it from printing each note).

Second, the program will save the entire song on disk in the file you name in line 200. Third, the program will rewrite itself if you select the MAKE DATA option. Make sure, however, that you have already SAVED a version of the program with your new melody on it, because the MAKE DATA option destroys all the lines in which you entered the melody using musical notes.

VITAL NOTE: no matter what else you do with this program, the variable F\$ must be the very first variable assigned in your program. This is because the machine language routine takes the current note information directly from the very first variable in the variable table, which must be a string, and must contain the pitches of the notes for all three voices in order.

HOW TO PUT MELODIES INTO THE VIC

To use the program *VIC Music*, you can't use musical notation; you'll have to calculate the pitches yourself, using the table printed above. Your routine for entering the melody should be placed at line 9100. The variable SL must be set to the total number of notes in the melody. Then you must assign the duration of each note to the string MD\$ and the pitches for each voice to the strings M1\$, M2\$, and M3\$.

VITAL NOTE: it is absolutely essential that MD\$, M1\$, M2\$, and M3\$ be the first four variables mentioned in your program, *in that order*, because the machine language routine reads those string variables from the start of the variable table. Also, all four strings must contain exactly the same number of characters.

Notice that the melody included with this program assigns all the notes exactly the same duration. It could just as easily have read all the durations from a DATA statement, just as it now reads all the pitches. Also, notice that only M3\$ is assigned its pitches from the DATA statements. M2\$ and M1\$ are then set to be the same as M3\$. (Since M3\$ has the highest voice, it will probably be most useful as the melody.)

Any pitch value from 0 to 127 will cause a note to be played, since it will be added to 128. If you want a note to be a rest or tacet, put it in the DATA statement as 128 or greater, since line 9110 converts any DATA value above 127 to 0, which shuts off the sound of that voice until the next note.

Half the fun, however, will come from your own experiments. Enter your own melodies and change the envelopes to see what happens.

(Note: If your program performs any cassette, disk, or RS232 operations after the sound routines are set up, they will have to be set up again, since the ML routines will be wiped out.)

That's enough for this month. Next month we'll finish with sound by playing around with sound effects for the VIC and 64. Then we can get back to something we can see. ☐ **SEE PROGRAM LISTINGS ON PAGE 90**

Most of us are well aware of the two types of memory inside our computers. We can hardly miss the significance of random-access memory (RAM), as the term is a prime selling point for most manufacturers. The C-64 has 64 kilobytes of the stuff, which is used for the temporary storage of programs and data. The VIC 20 comes with only five kilobytes of RAM, with provisions for adding up to 35 kilobytes externally. Actually, both the C-64 and the VIC 20 have an additional 1,024 nibbles of RAM (a nibble is four bits, or half a byte) which is used for the screen color map. In the C-64, these nibbles share the address space at \$D800-\$DBFF (55296-56319) with the character ROM and the system RAM.

Read-only memory (ROM) is not as well known to most users, since it plays a much smaller part in most promotional literature. Yet it is the programs in this permanent storage which give the computer its built-in personality. Both the VIC 20 and the C-64 are equipped with 20 kilobytes of ROM. The machine language programs which make up BASIC 2.0 and the operating system require 16 kilobytes of ROM. The remaining four kilobytes store the patterns for the Commodore character set. Without this permanent storage, the computer would be about as useful as a doorstop when first turned on.

Early users of microcomputers were not nearly as fortunate. In those bygone days of yesteryear (the early 70's) the personal computer had to be initially programmed by hand via a series of switches. This would usually allow for the loading of several hundred bytes of additional code, usually stored on a punched paper tape. This had to be done every time the computer was turned on. By the mid 70's things had improved somewhat. ROMs storing as much as 256 bytes had dropped in price to the point where a serious hobbyist could afford them. There was even talk of one kilobyte chips. As we shall shortly see, we have come a long way.

**A Guide to Permanent
Program Storage in
Read Only Memory**

PROGRAMMING YOUR OWN

Several types of ROM are presently available. The kind that come in the VIC 20 and the C-64 are the mask programmable variety. These are used because of their extremely low cost (pennies per chip) in mass production quantities. For small users or hobbyists they are of little interest, as the initial setup costs are very high. The most popular type for individual users are the erasable programmable read-only memories (EPROMs). These have always been considered essential tools by serious computer hobbyists.

The Commodore PET series of computers were even equipped with several empty chip sockets for the express purpose of installing additional ROM. In fact, these machines were not intended to have more than 32 kilobytes of RAM. Some quirks in the VIC 20 and C-64 operating system are relics from these forerunner machines. A notable example is the inability to perform a memory dump to tape from addresses above \$7FFF (32767).

The designs of the VIC 20 and the C-64 have placed less emphasis on personalized PROM programming. This is in spite of the fact that both machines have provisions for considerable software on plug-in ROM cartridges. Nevertheless, supporting products for PROM programming have always been available for both computers. Those so inclined can readily avail themselves of this fascinating and useful technology. The state of the art is such that we feel at the very least every user group should consider acquiring the hardware for the convenience of their members.

Burning a ROM once referred to the process of placing a program into permanent memory. ROMs are no longer burned. This term is a hold-over from the early days when some varieties of memory were programmed by literally burning open selected fusible links. This crude process has been replaced by the floating-gate avalanche-injection metal-oxide semiconductor transistor (FAMOS). These are specially fabricated field-effect transistors which

have the ability to store a minute electrical charge. In the discharged state the transistor looks like an open switch. This represents a binary one. When the charge has been placed, the switch is effectively closed to represent a binary zero. An EPROM chip is actually an organized conglomeration of these devices on a tiny bit of silicon.

HOW THEY WORK

A factory fresh PROM is completely discharged. In this state all the bits contain a one. If you were to examine an unprogrammed PROM you would find that each byte contains the value of \$FF (256). The programming process consists of three steps. First, the proper address is selected. Second, the information to be stored is placed on the data lines. Finally, a high programming voltage (usually 24 volts) is placed on the programming pin. This voltage has to be very carefully controlled. If it is applied for too long, damage to the chip may result. If it is applied for not long enough, insufficient charge will be deposited and the stored information will be unstable.

EPROMs have one other characteristic which makes them so desirable as a development tool. Once the data has been properly programmed it is quite permanent, with a storage lifetime of many years. However, under the proper conditions, the data can be removed and the EPROM may be reused. In fact, with proper handling, there is no limitation on the number of times this cycle may be repeated. The EPROM is erased by illuminating the cells with ultraviolet light of a particular wavelength (2537 angstroms to be exact). A quartz window is thoughtfully provided on the chip package for this very purpose.

A PROM programmer is a specialized device designed to generate the necessary addresses, data, and programming voltages. A properly designed programmer will include enough built-in flexibility to handle a variety of EPROM types.

THE EPROM FLAVORS

EPROMs come in a variety of con-

figurations. The most popular nowadays are the 2700 series, where the memory cells are arranged in an array which is eight bits or one byte wide (that is, addressing a single location returns a full byte of data). In contrast, the RAM chips in the C-64 are set up as a single bit per address. It takes eight chips in parallel to make up a single byte.

Memory chip capacities are specified in bits, not bytes. Thus, to obtain the chip's byte capacity, you have to divide by eight. The last two digits of the chip number represent the chip capacity in kilobits. For example, a 2764 contains 65,536 bits of storage capacity organized as eight kilobytes. Incidentally, the 2764 happens to be the most popular PROM chip for hobbyists as of this writing. It offers the lowest cost per bit among the available chip sizes. It also happens to be the capacity of the ROM chips used by the VIC 20, the C-64, and the 1541 disk drive for their operating systems. The 27128 is not far behind in a direct cost comparison. Its desirability hinges on placing 16 kilobytes of storage in a single socket. The 27256 (32 kilobytes) is also reasonably priced if you need the capacity. The 27512 (64 kilobyte) holds a whopping half a million bits of data. As of this writing, it is still priced beyond most hobbyists at several hundred dollars. However, we are all aware that prices in the semiconductor industry tend to drop rapidly as time goes on.

The user should also be aware of the number of pins required for the different chips. The ROMs in the VIC 20 and the C-64 are in a 24-pin package. All the chips mentioned above come in a 28-pin package. The manufacturers have made the pin layouts very similar, so that an adapter can be easily constructed. A 24-pin variety of the eight kilobyte EPROM is available. The model MCM68764 from Motorola fills the bill at a price which is currently five to six times as high as the 28-pin 2764.

When shopping for chips, keep in mind the other factors that affect price. These are primarily speed and power consumption. Given the slow

clock speed of the C-64, the former is generally not a problem. Unless you plan on assembling some large memory arrays, the power consumption is not significant either.

ADDING MEMORY TO THE C-64

The Commodore 64 was specifically designed to allow for considerable memory expansion. This may seem a bit odd in light of the multiple memory layers which already fill parts of the computer's memory space. Nevertheless, every time a cartridge is plugged into the expansion port, memory is added to the computer.

For most game cartridges, this memory amounts to another eight or sixteen kilobytes of program on ROM. Generally, these cartridges are not true memory expansions. What actually occurs is a replacement of internal RAM and ROM by what is contained in the external cartridge. Most cartridges utilize only a small portion of the existing RAM. Thus a game cartridge can best be considered as turning the C-64 into a dedicated game machine while it is in place.

Some cartridges add to the C-64 memory resources. The Super Expander cartridge from Commodore contains eight kilobytes of ROM. When it's installed, the BASIC of the C-64 is enhanced by a set of graphics and sound commands. At the same time, eight kilobytes of BASIC RAM is hidden under the external ROM reducing available program space. The Super Expander cartridge does not waste this hidden RAM. It is utilized for the bit mapped graphics associated with the added BASIC commands.

Perhaps the most ambitious expansion of C-64 memory to date in a finished product is implemented by the Comal 2.0 cartridge. This contains the latest version of the Comal language on 64 kilobytes of ROM. As if this was not enough, an empty socket is provided on the board for an additional chip with a capacity for up to another 32 kilobytes.

The all-time prize for user expansion goes to the Jason-Ranheim Com-

pany, who make an eight-socket board which can accommodate up to 256 kilobytes of external ROM. Memory expansion need not be restricted to ROM. Additional RAM can be added to the expansion port. This is just the approach taken by the R. J. Brachman Co. with their CBUS II cartridge. We will be looking at both products later in this article.

HOW IT IS DONE

The designers of the Commodore 64 provided for all this expansion by building considerable flexibility into the cartridge port. To actually see how this is done, we will have to dig a little deeper. There are two primary devices which control the memory configuration of the C-64.

The first is a six-line I/O port built into the 6510 microprocessor. The internal hardware of the 6510 places this port at memory address 1. Its associated direction control register is located at address 0.

The second device is a custom designed integrated circuit, the Programmable Logic Array (PLA). This chip is a collection of electronic switches (as are all logic devices) designed for the express task of managing the memory configuration requirements of the C-64. Internally it is responsible for the sharing of memory between the 6510 and the 6567 VIC II chip. Externally it is the control device for the expansion port.

The expansion port can best be described as a full microprocessor bus. It brings to the outside world the entire set of eight data lines and sixteen address lines of the 6510. In addition, there are several control lines which are associated with the PLA. Two of these lines, EXROM (pin 9) and GAME (pin 8), are hardware inputs to the PLA. These are normally held to a logical one represented by +5 volts in the C-64. The horizontal line over their labels indicates that their intended logical function is implemented when they are set to a logical zero or 0 volts in the C-64.

When a cartridge is plugged into the expansion port, one or both of these lines are grounded. This causes some of the internal memory of

the C-64 to be replaced by whatever is in the cartridge. The affected memory areas are the eight kilobytes of RAM from \$8000 to \$9FFF (32768 to 40959). The eight kilobytes of BASIC ROM from \$A000 to \$BFFF (40960 to 49151) and the eight kilobytes of KERNAL ROM from \$E000 to \$FFFF (57344 to 65535). These lines work in conjunction with two output lines at the port, ROML (pin 11) and ROMH (pin B). The former addresses in the eight kilobyte \$8000 block, while the latter controls either the \$A000 or the \$E000 block.

The effect of all four of these lines can be further modified by the 6510 I/O control port at address 1. This can be used to switch between ROM (either internal or external) and the built-in RAM that occupies the same address space. Some cartridges exert direct control of the hardware memory configuration by placing electronic switches at the EXROM and GAME lines. These "soft switches" are accessed by selecting a particular address for their control. Additional RAM or ROM can be switched in or out, usually in eight kilobyte banks, by installing additional control logic on the cartridge. This is the technique used by the Comal cartridge mentioned above.

SOME PROM APPLICATIONS

Most of us are familiar with the dozens of games and applications programs available in cartridge forms. The C-64 and VIC 20 offer other possibilities for custom ROMs. These range from changing the character set to direct modifications to BASIC and the operating system. The default language could even be changed. How about a C-64 that understands FORTH or PASCAL? Think of all the possible applications for dedicated autostart programs. This would allow the computer to be used as an untended control device without the need for a disk drive or cassette deck. The list is endless. The three reviews that appear on the succeeding pages present some interesting products which offer some unique ideas of their own. □

gramming system for use with the Commodore 64 or the VIC 20. Stand-alone ROM programmers are relatively expensive items. Much of the expense resides in supplementary hardware requirements. These include memory for data and control program storage, a controlling microprocessor, and of course a power supply. The Promenade utilizes the existing facilities of the computer to create a very effective ROM programming environment. The capabilities of a Promenade with a C-64 or a VIC 20 and a 1541 disk drive actually exceed those of more expensive dedicated units. That includes the cost of the computer and disk drive.

VIC 20 users take note. The Promenade system will function properly without any memory expansion. However, programming ROMs which exceed the memory capacity of the unexpanded VIC 20 will be somewhat inconvenient. A minimum of eight kilobytes of expansion RAM is recommended.

THE HARDWARE

The Promenade itself is a slim 4½ x 5" package in a brushed aluminum case. In use, it is installed in the computer's user port. The top surface of the Promenade is dominated by the 28-pin zero insertion force (ZIF) dual in line package (DIP) socket flanked by green, red, and yellow indicating lights. These light emitting diodes serve to indicate the status of the system at all times. The first (green) simply displays the presence of power to the Promenade. The second (red) indicates when the ZIF socket is energized, such as during a ROM read operation. It also serves as a warning not to insert or remove a PROM when it is lit. The third (yellow) alerts the user to a ROM programming activity. It also flashes when some kind of programming error takes place.

THE OPERATING SYSTEM

The *PROMOS* software, supplied on either cassette or disk, makes the reading and programming of PROMs a snap. *PROMOS* is designed to let the user work with a

PROM in a fashion which is very similar to using the cassette or disk drive. In fact, *PROMOS* assigns device number 16 to the Promenade. When activated, *PROMOS* behaves very much like a DOS wedge. It makes full use of the computer's operating system. Programs can be *LOADed* and *SAVED*. Files can be *OPENed* and *CLOSEd*. Data can be written with the *PRINT#* and *CMD* commands and retrieved via the *GET#* and *INPUT#* commands. There is even a directory command, the dollar sign (\$), which returns the contents of the ROM.

PROMOS reserves part of the ROM space for the directory information. Unlike the disk drive, the *PROMOS* directory is spread out through the ROM with the associated files. A series of links, similar to BASIC's internal line links, keeps track of each file's relative position. Complete details of the *PROMOS* file structure are included in the twenty-page manual.

The *PROMOS* file-oriented operation requires the presence of the Promenade to function. This limits the capacity of the PROM filer to what can be stored in a single chip. The Promenade can handle chips with a capacity of up to 512 kilobits (64 kilobytes). As mentioned earlier, chips with this capacity are still quite expensive. Thus most users will limit themselves to eight or sixteen kilobytes of online storage. A useful enhancement to *PROMOS* would extend this file-structured operation to the PCC-2, -4, and -8 expansion boards discussed below. This enhancement would allow for the creation of a ROM disk with up to a quarter megabyte capacity.

PROMOS also includes two direct memory commands, the Greek letter pi and the British pound symbol. These allow for the direct bidirectional transfer of data between the computer's memory and the PROM. The command syntax is very similar to that used by most machine language monitors. *PROMOS* has been designed to be highly compatible with most machine language monitors. The commands will generally work from within a monitor, although an

occasional question mark indicating a monitor syntax error does appear. The solution is usually just to reissue the command. The manual recommends *Hesmon* for use with *PROMOS*. A cartridge-based version which includes *PROMOS* and a DOS wedge is available for \$24.95. We found that *PROMOS* seemed to work well with *Micromon*, a very powerful public domain machine language monitor.

The Promenade has enough built-in flexibility to handle a large variety of EPROMs of varying capacities and types. *PROMOS* accepts two parameters which allow the system to distinguish among the various types of EPROMs. The "control word" number tells the operating system which type of EPROM is being used. The manual lists 23 PROM types, to which the 27512 has recently been added. This includes the 48016P, which is an electrically erasable device (EEPROM) for which *PROMOS* includes a special erase command.

The second parameter lets *PROMOS* optimize the programming operation. The Program Method Word (PMW) selects from four methods of PROM programming. One is based on the chip manufacturers' recommendations. The other three are "intelligent" methods which optimize programming time. The method developed by Jason-Ranheim uses a series of increasingly longer pulses till the data has been verified. Thus for an eight kilobyte ROM, which would normally take seven minutes using the standard method, we found programming times as short as 30 seconds with the Jason-Ranheim method.

PROMOS was kept as brief as possible to minimize its memory requirements. The code is fully relocatable by simply changing the top-of-memory vector before *RUNning* it. This brevity does leave the program open to operating problems. Under some conditions it is possible to crash the program while all of the Promenade lights are still on. If a PROM is in the socket, damage to the chip might result. A hardware protect switch to disable the socket could be a useful addition.

OTHER SUPPORT PRODUCTS

Jason-Ranheim offers several circuit boards for installation in the computer expansion port. A VIC 20 board (PVC-2) and a C-64 board (PCC-2) priced at \$6.95 each support up to two eight-kilobyte ROMs. For the VIC 20, any one of the four eight-kilobyte expansion blocks can be used. The C-64 board uses the two eight-kilobyte blocks located at \$8000 to \$BFFF. Instructions are provided on how to store a BASIC program in ROM which will autostart when the computer is turned on. Two program listings are provided, one which RUNs the program from cartridge memory and the other which downloads the program to the usual BASIC memory space before RUNning.

Also available are two additional bank switching circuit boards. The PCC-4 (\$19.95) will accommodate up to four ROMs with either an eight-, sixteen-, or thirty-two kilobyte capacity for a total of 128 kilobytes of add-on memory. This memory will appear in eight-kilobyte bank switched chunks at the \$8000 block. The bank select register can be located at either \$DFFF (57343) or \$DEFF (57087). Any eight-kilobyte bank or none at all can be switched in or out. The PCC-8 (\$29.95) is similar, except eight sockets are provided for up to 256 kilobytes of external ROM. Complete instructions are included, along with a *DOWNLOAD/RUN* program for installing up to 38 kilobytes of program with an autoboot routine in ROM.

Before you go running off with visions of putting all your favorite applications in nearly instantaneously bootable form, keep several things in mind. Most commercial software is copy protected and in machine code. It will require a fairly knowledgeable user and some time to extract the programs and put them into the proper format for use with this method. So if you have the programming capability this presents an excellent way to get your favorite word processor, spreadsheet, and database all online at one time.

No PROM programming system

would be complete without some means of erasing a previously programmed PROM. Jason-Ranheim does not make an ultraviolet eraser of their own, but they will supply "hobbyist" and "industrial" versions of these devices for \$34.95 and \$79.95 respectively.

CONCLUSIONS

The Promenade is a good general purpose PROM programming system. Some unique support products make it very attractive to the moderately advanced user. The built-in hardware and software flexibility, coupled with some excellent technical support, make it a good choice for turning the C-64 or VIC 20 into a PROM development system.

The Promenade is available for \$99.95 with the supporting software on tape or disk. □

ADDENDUM

Jason-Ranheim is continuously coming up with new uses for the Promenade. As we went to press we received word of a new four-socket expander board (PRB-4) similar to the PCC-4. The PRB-4 is designed to accommodate two eight-kilobyte PROMs and two eight-kilobyte RAM chips. An onboard battery backup allows the RAM to retain data after the C-64 has been turned off. According to John Ranheim, president of the company, the PRB-4 is being used as an aid for educating the homebound handicapped. An examination is programmed into the PROMs. The student's answers are stored in the RAM. The battery backup retains the data for subsequent grading under computer control. Price is \$24.95.

CBUS I & II: THE CARTRIDGE BACKUP SYSTEM

R.J. Brachman Associates

The CBUS (Cartridge BackUp System) is a product which will undoubtedly evoke considerable contro-

versy. It is marketed with the primary intent of allowing a user to copy and use the software which is stored in the ROM chips of a Commodore 64 program cartridge. This attitude, while probably reflective of good marketing sense, is somewhat unfortunate. As we shall see, the CBUS package does have a valid purpose in the C-64 scheme of things.

THE HARDWARE

CBUS is primarily a hardware accessory. The total system consists of two parts available separately or as a package.

The CBUS I is essentially a single slot expansion port extender board. This in itself is unremarkable. What makes the CBUS I unique is the inclusion of an eight position DIP switch. There is also a reset push button which does come in handy at times (see the May '85 *Ahoy!* for more on reset buttons). The DIP switches intercept the four cartridge control lines which were described in the introduction to these reviews. By properly manipulating these switches, the particular configuration of nearly any 16 kilobyte cartridge can be determined. Once this is known, the cartridge contents can be downloaded to disk. This can easily be done with a machine language monitor or with the custom program listed in the manual.

Once on disk the cartridge can be dispensed with. The program can be then loaded into the C-64's resident RAM and RUN from there—well, almost. As it turns out, very few cartridge-based programs are directly amenable to this sort of treatment. For various reasons, most cartridge software will require some modifications to RUN in this fashion. Since these programs are nearly always written in machine language, this task is not for the uninitiated. A select number of cartridges cannot be so converted, as they utilize the underlying RAM which shares their program space.

This is where CBUS II comes into the picture. Although it physically resembles the typical cartridge which it is intended to replace, internally

there is a world of difference. In place of the expected ROM, the CBUS II contains sixteen kilobytes of static RAM. To complete the picture, the CBUS II contains a hardware "personality latch" which allows the RAM to emulate any of seven possible 16-kilobyte cartridge configurations which are available for the C-64.

To complete the picture, a program listing is included with the documentation which will LOAD in a cartridge "snapshot" and configure the personality latch accordingly. Once loaded, the cartridge program can be started by locking the latch with the RUN/SET switch and then hitting the cartridge reset button.

THE DOCUMENTATION

Each of the CBUS modules come with its own instruction manual. The CBUS I manual provides a thorough description of the various cartridge configurations. Included are complete instructions on how to identify a cartridge with the CBUS I. Two brief programs are listed which allow you to create a menu-driven disk-loaded version of all your cartridges. The manual also includes a detailed breakdown of all the possible C-64 memory maps and how they are created. This is one of the most comprehensive discussions we have come across on the subject. The interaction between the 6510 internal control port located at memory addresses 0 and 1 and the hardware control lines is meticulously detailed.

The description in the CBUS II manual is limited to the basic operation of the CBUS II cartridge as a cartridge emulator. It includes a program listing especially suited to the unique hardware of the cartridge. Both manuals include source code listings of the machine language portions for reference purposes. For advanced users, a full description of the CBUS II operation is included in the optional Technical Manual, along with a brief discussion on using the CBUS II as a cartridge program development tool.

Several pamphlets were included with the package. These appear in a newsletter format. They deal with the

specific nuances of particular cartridges for working with the CBUS system. One pamphlet lists the CBUS classifications for 75 commercially available C-64 cartridge programs.

The entire package is intended to let the average user copy and run cartridge-based software. The CBUS I and II manuals include detailed procedures on the proper use of their respective hardware and software.

As we went through the manuals, one area for improvement became evident. The largest manual was a bit over twenty pages. There was considerable amount of duplication of information across all three manuals. A significant percentage of each manual consists of overhead such as introductions, tables of contents, and copyright and warranty notices. We feel that both manufacturer and end user would benefit if the manuals were consolidated into one book.

CBUS-I allows the user to examine the contents of any Commodore 64 cartridge.

CBUS-II contains 16 kilobytes of static RAM with cartridge emulation circuitry.

THE SOFTWARE

If you opt for CBUS I Deluxe or the complete package, you will get all of the appropriate software on disk. This includes a menu generator program for use by either of the loader programs. Also included are two versions of Jim Butterfield's *Su-*

permon and a *Mini-Monitor* designed specifically for use with the CBUS package. The latter is a hybrid of machine language and BASIC. Overall we found the provided support programs to be effective but lacking in polish. But then again, their brevity is considered a virtue for this particular application.

WHAT IT'S GOOD FOR

The manufacturer places primary emphasis on the benefits of transferring cartridge software to disk. The saving of wear and tear on the cartridge port is one case in point. Additional benefit is to be obtained by the reduction of storage requirements, as several cartridges can be kept on one disk. Also touted was the convenience of being able to load programs directly from disk. We leave the evaluation of these considerations to the end user. We did feel that being able to rapidly swap cartridges held the edge in convenience.

We would have liked to see additional emphasis placed on the capabilities of the CBUS II as a cartridge development system. In this light, it would make an ideal companion to either of the ROM programmers in the accompanying reviews. Being able to try out a cartridge-based program in a total cartridge emulator without the need to continuously erase and reprogram a ROM is a convenience worth looking into.

Although the CBUS II cartridge includes sixteen kilobytes of RAM, do not expect to use it as expansion memory. The design of the CBUS II and its associated personality latch prevents simultaneous read and write operations to its RAM. The hardware can be configured to store data into the RAM or to read the data from it, but not both. To engage in two-way communication with CBUS II, your software would have to continuously reconfigure the personality latch.

CONCLUSION

The CBUS is an effective tool for manipulating cartridge firmware. The CBUS II is a valid cartridge development tool as a total cartridge emulator. If you already own an expan-

sion chassis for your C-64, then you may consider adding the CBUS I switches yourself. Although it does involve some soldering and cutting of printed circuit traces, it is not an overwhelming task. CBUS I sells for \$34.95. CBUS II is \$84.95. An additional \$15.00 gets you CBUS I Deluxe, with the associated software on disk. The entire package can be had for \$119.95. □

CARTRIDGE-MAKER-64: EPROM PROGRAMMING FOR THE MASSES

Custom Programming Group
47 Marchwood Road—Ste. 2A
Exton, PA 19341
Phone: 215-363-8840

The Cartridge-Maker-64 system simplifies EPROM programming so that anyone can do it. The entire chip selection process, along with the need to handle individual chips, has been eliminated. This operational simplicity does have its limitations. The system is designed to program only one type of EPROM, the 64 kilobit (eight kilobyte) 2764.

THE HARDWARE

A complete Cartridge-Maker-64 system consists of four components: the Cartridge-Maker-64 itself, a cartridge eraser, a blank Cartridge-64, and the user manual. These are available as a complete kit or as individual components.

The central component is the Cartridge-Maker-64, an EPROM programming module designed to program one or two type 2764 EPROMs. This 4 x 6 x 1 1/4" module fits into the computer's expansion port. An edge board connector at the back of the module accepts standard Commodore 64 program cartridges. A three-position toggle switch controls the power to this connector. The electrical status of the connector is indicated by a pair of light emitting diodes: a green one to indicate the presence of power and a red one to indicate programming activity.

Hidden inside this black box is the PROM programming and control cir-

cuitry. This allows the single switch to electrically isolate the Cartridge-Maker-64 connector. When the switch is in the OFF position, it is safe to insert or remove a cartridge without turning off the computer. Also included in the package is an eight kilobyte operating system on ROM. This program takes care of all the cartridge reading, writing, and

Cartridge-Maker-64 lets you program up to two 2764 EPROMs at one time.

The built-in ultraviolet light source allows you to erase your EPROMs.

user interface tasks. The system is flexible enough to allow for the complete programming of a sixteen kilobyte cartridge without the need for a disk drive or cassette deck.

The cartridges designed for use with the Cartridge-Maker-64 are similar, but not identical, to commercial C-64 cartridges. Each Cartridge-64 comes fitted with a pair of type 2764 eight kilobyte EPROMs permanently

soldered into place. The board's circuitry is designed to allow the 21 volt EPROM programming voltage to be applied by the Cartridge-Maker-64. The board is also fitted with a six position DIP switch for setting Cartridge-64 to any of four standard C-64 cartridge configurations. These consist of eight kilobyte cartridges at the \$8000 or \$E000 blocks or sixteen kilobytes at the \$8000/\$A000 or \$8000/\$E000 blocks. The EPROMs may be programmed individually or in pairs. This allows up to two Commodore 64 cartridges to be copied onto one Cartridge-64.

The Cartridge-Eraser is an ultraviolet light source designed to erase a Cartridge-64 in less than ten minutes. A safety interlock is built into the top of the case to prevent accidental exposure to the ultraviolet light. This light is intense enough to cause damage to the eyes. The switch is recessed inside the top cover well away from accidental activation. However, it is readily reached by prying fingers. Avoid this temptation and keep the eraser away from small children.

Although the hardware is specifically designed for PROM programming in the C-64 cartridge configuration, the system can be easily adapted for the programming of individual type 2764 PROM chips. A bare Cartridge-64 printed circuit board is available for \$12. You will have to install your own six or eight position DIP switch for chip selection. Two 28 pin DIP sockets should also be soldered onto the board. These should be of the zero insertion force (ZIF) construction. When complete you will be able to easily program 2764s, individually or in pairs, with the Cartridge-Maker-64 system.

THE FIRMWARE

Cartridge-Maker-64 comes with its own built-in menu-driven software in an autostart ROM. The opening menu lets you select the screen colors. This is followed immediately by the main menu with the nine system selections. The first of these is the *Cartridge to Cartridge* utility. This function will automatically identify the original cartridge type and read

the data into memory. You will then be instructed in the proper switch settings for the Cartridge-64. Simply follow the prompts for switching cartridges and setting the program control switches.

Cartridge-64 will not work with cartridges designed for switching between external ROM and C-64 internal ROM or RAM. These cartridges are equipped with onboard hardware latches that Cartridge-64 does not emulate.

The next two main menu choices deal with the placing of BASIC programs into cartridge. This will let you create an autostart cartridge without any knowledge of machine language. When the computer is turned on the program will be automatically downloaded into the normal BASIC program area and RUN from there. The program can even be STOPed, LISTed, and modified as desired. BASIC programs in cartridge are limited to a maximum length of 8,000 bytes by the Cartridge-Maker-64 system. The presence of the Cartridge-64, which contains the BASIC program, also reduces BASIC program space to thirty kilobytes. Placing a BASIC program into a cartridge is a simple way to create an autostart program which will not require a disk drive or cassette deck to LOAD and RUN.

The next two menu choices allow for the transfer of data between cartridge and memory. These are the basic 2764 programming modes. Locations \$6000-\$9FFF serve as a buffer area in the C-64. You will have to LOAD these buffer areas with the appropriate data before using these menu choices.

The next four main menu selections deal with the transfer of data from disk or tape to or from a C-64 cartridge. Cartridge-Maker-64 disk files are sequential files. Tape files are program files. Included in all files is information on the original cartridge type in addition to the program data.

The last menu choice lets you exit to BASIC. A simple SYS call will enable you to reactivate the Cartridge-Maker program.

THE MANUAL

All of the Cartridge-Maker-64 system features are thoroughly described in the thirty-page user's manual. The presentation is geared to the user with a minimum of technical background. However, some understanding of the C-64 memory structure is needed to obtain the maximum benefit from this system. Complete details of the Cartridge-Maker file structures, as well as descriptions of the various C-64 memory maps, are included.

CONCLUSION

The Cartridge-Maker-64 system is certainly an easy-to-use EPROM programmer. This ease of use incurs a substantial penalty with regard to overall flexibility. The system is limited at best to the programming of a single type of EPROM. Although considerable emphasis is placed on the copying of cartridges, it is unlikely that this will be cost effective. An entire system, including the eraser and programming modules as well as a single sixteen kilobyte module, sells for \$189. Additional sixteen kilobyte modules, with EPROMs, are \$25 or five for \$115. The system can be used to minimize program development times by allowing BASIC programs to be placed into cartridges. This storage medium is suitable for custom applications in unattended locations where the harsh environment may preclude the use of a disk drive.

AUTHOR'S NOTE

A machine language monitor (MLM) is required to obtain the maximum benefit from these products. Several excellent MLMs are available in the public domain. If you have not yet come across these programs, I will provide a copy of my MLM disk for a \$12 copying and distribution fee. This self-documenting disk includes *Extramon*, *Micromon*, and some disk editing utilities. Send your request to Morton Kevelson, P.O. Box 260, Homecrest Station, Brooklyn, NY 11229. □

SPEEDING PIXELS

Some Assembly Language Help for Bit-Map Graphics

By Dale W. Rupert

We saw last month that BASIC is very sluggish when it comes to manipulating the 64,000 pixels in high resolution bit mapped graphics. This month we will develop two assembly language routines to help speed things up. The first routine does nothing more than clear the 8000-byte bit map memory. The second routine performs the calculations necessary to locate a pixel on the screen and puts it there.

When we are finished this month, we will have a somewhat cumbersome interface to BASIC. We must still

POKE X and Y values in order to plot the point (X,Y). We will not be able to draw lines instantly between any two points. But we will have the groundwork on which to build other capabilities in the future. We will create some very diverse assembly language modules. Consequently, you may find this article useful as a machine language tutorial.

PRELIMINARIES

The BASIC program on page 89 (Listing 1) is similar

"You've Tried The Rest... Now Try The Best!"

A clever advertising slogan? Perhaps. But we at Artworx have found that phrase to apply to our **ALLEGRO** advanced music synthesis program. Most of our registered **ALLEGRO** customers already own at least one of the "better selling" music programs for the Commodore 64. So why do they continue to spend good money for yet another music program? Mostly because the other programs are not complete. They may produce nice music, but won't allow that music to be put into a computer program; or they have fancy "slider" controls for ADSR envelopes but have an impossibly difficult means of music entry; or they have fancy joystick controlled note entry but don't play worth a darn. Not so with **ALLEGRO**.

ALLEGRO IS DIFFERENT

ALLEGRO is a complete music synthesis program. By that we simply mean that **ALLEGRO** does everything required to obtain professional quality electronic music. It does it well, it does it easily and it does it intelligently - with no distracting gimmicks for the sake of gimmicks. And it does it all on one disk. You will not have to spend an extra \$35 for a "synthesizer" disk or \$25 for a disk that allows you to play music from the keyboard. And you won't be frustrated by incomplete instructions - **ALLEGRO** comes with over 70 pages of extensive documentation taking you from theory to application and all points in between. It even contains helpful information on hooking up your stereo to the computer and including your music in your own BASIC or assembly language programs. One review stated that **ALLEGRO** "...is a technical work of art. The demo songs are truly stunning, the 74-page manual is worth the purchase price for its clear discussions of music and digital sound."

ALLEGRO'S FORTE EDITOR

ALLEGRO consists of four parts: the Editor, the Instrument Builder, the Registers Control and the Modulations Control. The Editor is used to enter and edit your music. This is accomplished using the specially developed FORTE music notation language. It is the fastest method of inputting a musical score - easily beating out the the best of the joystick controlled "note and staff" methods, and very simple to use for modifying or correcting your music. With the FORTE editor, you will be able to create music that can use up to 85 different instruments in one piece, or choose any of the 50 pre-programmed instruments that come with the program. **ALLEGRO** gives you the widest flexibility in musical range, it handles notes as short as a 64th triplet and has over 900 tempo settings. Each piece can contain over 5800 individual notes (!) and endless repeats. The dynamic range spans not only eight audible octaves, but five additional *sub audible* octaves for special effects!

INSTRUMENTS

Every music program comes with pre-programmed instruments, but **ALLEGRO** has over 50 ranging from harpsichord to drums to bagpipes. Every music program allows you to change instruments within a piece, but **ALLEGRO** gives the user the flexibility of selecting any of up to 85 instruments. And any of these instruments can be modified or replaced by another group of 85 user-defined instruments. Coupled with **ALLEGRO's** use of registers and modulations (using over 20 oscillators available within the Commodore 64), all sorts of unique instrumental sounds are at your disposal.

SPECIAL EFFECTS AND FEATURES

ALLEGRO's Registers and Modulations controls give you more control over your performance than with any other program available. **ALLEGRO** supports all possible filter and cut-off combinations, and resonances too. It provides ring modulator, phaser and heavymetal effects (250 levels) as well as adjustable vibrato and siren effects. It has pulse width sweeps for fuzz bass and realistic piano sounds as well as filter sweeps for wah-wah and dynamic timbre changes. And once a composition has been completed, it can be stored as an interrupt driven PASSKEY file which can be called from the user's own program by a one line instruction. A PASSKEY file can hold a maximum of 41 songs and requires only 4K from BASIC regardless of the amount of music that it contains!

PERFORMANCE FEATURES

ALLEGRO can turn your Commodore 64 into a real time musical instrument allowing you to play along with pre-programmed background rhythms directly from the keyboard. In fact, you will find that the **ALLEGRO** keyboard layout is compatible with certain add-on piano style keyboards. There are two performance modes: monophonic, for playing single notes along with a background track, and polyphonic, using three voices and simultaneous keystrokes allowing real chords to be played. During performance, you will be able to change instruments, octaves, vibrato, staccato, wah wah and more with just one keystroke!

SUMMING IT UP

As you can tell, we're pretty keen on this program. It's the perfect program for the beginner because of its straightforward layout and clear documentation. It's the perfect program for the knowledgeable user because of its flexibility and ease of music entry and transcription, and it's the perfect (if only) program for the professional because of its completeness and capabilities—it has already been used to create the music for at least two best-selling Commodore programs. With **ALLEGRO**, Artworx has provided all the necessary tools, the **ALLEGRO** user is limited only by imagination.

FREE OFFER!

No, **ALLEGRO** does not come free. It costs \$39.95 and if you buy it direct from Artworx, it will cost you an additional \$2.00 for postage (and New Yorkers will have to pay sales tax). What we will include at no extra cost is an **ALLEGRO** sampler disk containing over 40 musical selections contributed by **ALLEGRO** users. Ranging from baroque to punk, these selections provide hours and hours of unique musical composition. No, you will not find "Home On The Range" or "Jingle Bells" on this disk! There is one catch, however: we must receive your order before July 31, 1985. Call toll-free: 1-(800)-828-6573 or send check or money order. VISA or MasterCard gladly accepted.

to the program we discussed last month. To begin, let's review the concepts and procedures involved in high resolution bit map graphics.

The bit map consists of 8000 bytes beginning in RAM at location 8192. Each of those 64,000 bits corresponds to a specific dot or pixel (picture element) on the screen. If a bit is set to one, the pixel is one color, and if a bit is reset to zero, its pixel is another color. The screen appears as an array of 320 (horizontal) by 200 (vertical) pixels.

The 1000 bytes of normal screen memory from locations 1024 to 2023 each store two nybbles of color data. The color resolution is 64 bytes. That means each byte of color data applies to 64 pixels on the screen. The data in location 1024 defines the possible colors for the 64 pixels in the upper left (eight-by-eight) corner of the screen. Similarly, the data in location 2023 defines the colors for the lower right corner. There are 16 possible colors to choose from, but each eight-by-eight block of pixels will consist of any two of those colors.

Some examples should clarify all this. Assume location 1024 contains the value \$24 (i.e. decimal 36—the “\$” signifies a hexadecimal value). The possible colors of the 64 pixels in the upper left corner of the screen are red and purple. To understand this, refer to the color values listed in Appendix D of the *Programmer's Reference Guide (PRG)* or Appendix G of the *User's Guide*. Red has a value of 2; purple has a value of 4. The hexadecimal number with one nybble of 2 and the other nybble of 4 is the value to select the colors red and purple.

To select light red and light blue for the lower right corner, put 174 (\$AE) or 234 (\$EA) into location 2023. Light red has a value of 10 (\$A), light blue has a value of 14 (\$E). The hexadecimal color code is then \$AE or \$EA. To convert to the decimal equivalent, multiply the first value by 16 and add it to the second: $16 \times 10 + 14$ equals 174.

The first color code (most significant nybble) corresponds to the pixels whose bit map memory bits are set to one, and the second color code is for the pixels whose bits are reset to zero.

The chart on page 125 of the *PRG* shows the rather complicated addressing structure of the bit map memory. The formulas for locating the correct memory location and the bit within that location for a particular pixel are contained in lines 400 to 420 of the BASIC program in Listing 1.

We saw last month that to use bit map graphics mode we must define the starting location of the bit map memory by setting bit 3 of VIC-II register 24. Then we must set bit 5 of VIC-II register 17 to enter bit map mode. Those functions are performed in lines 40 and 50 of the BASIC program in Listing 1. The user-defined functions FNSB and FNRB are “set bit” and “reset bit” functions. The statements `MM=VV+24 : POKE MM, FNSB(3)` set bit 3 of location MM, where MM has the address of VIC-II register 24.

The program in Listing 1 may be run without creat-

ing the machine language routines we are discussing here. Once you have assembled the two programs with filenames CLSCRN.O and PLOT.SCO and have them available on disk, you may delete lines 65 and 265 of Listing 1. Then the two machine language programs will be used instead of their BASIC equivalents. (If you prefer to get CLSCRN.O and PLOT.SCO up and running without assembling them, we've provided *Flankspeed* listings of each on page 89.)

It takes an interminably long time (roughly thirty seconds!) for BASIC to clear the 8000 bytes of bit map memory using a FOR-NEXT loop. In this type of application, machine language really shines. Let's see what it takes to speed up the screen-clearing process—by a factor of 135 or more!

NOW YOU SEE IT

The CLSCRN.O assembler listing puts zeroes into 8000 consecutive locations beginning at address 8192 (\$2000). The programs in this article were assembled with the *Merlin 64* macro assembler. The main differences between listings from different assemblers are the assembler directives, more commonly known as pseudo-ops. Pseudo-ops look somewhat like the genuine-ops, the mnemonic op-codes of the 6510. Actually they're instructions to the assembly itself, not to the processor.

Lines 6 and 10 through 14 of the CLSCRN.O listing contain pseudo-ops. ORG is fairly standard. It tells the assembler the ORIGIN of the program, that is, where this program will reside in memory. The EQU assigns a value to a label. In this case, it tells the assembler that a reference to PAGE0 actually refers to memory location \$FB. Neither ORG nor EQU cause any object code to be generated. Again, they are instructions to the assembler.

The DA and DFB pseudo-ops, on the other hand, do generate code. The assembler takes the values following each of these and places them in consecutive memory locations. DA stands for Define Address, and the value following it is stored in the standard "least significant byte (LSB) first, most significant byte (MSB) last" sequence. DFB allows the programmer to define one or more bytes to be put into memory. Both of these pseudo-ops also allow the programmer to assign labels to these values, similar to variables and the LET statement in BASIC.

A block of two hundred fifty-six bytes is referred to as a page. The eight thousand bytes of bit map memory corresponds to thirty-one pages plus 64 additional bytes. This routine uses the Y register to cycle from 255 down to 0, pointing to individual addresses on a page, while the X register keeps track of how many pages have been cleared. Once the 31 pages have been cleared, the number of extra bytes (64) is loaded into the Y register, and those bytes are cleared. Let's look at the details.

The DA statement in line 11 puts \$00 into address BASE and \$20 into the next location, which is BASE+1. For example, when this program is assembled, the JMP statement in line 8 consisting of three bytes is put into locations \$33C, \$33D, and \$33E (since the ORG was \$33C). Consequently BASE corresponds to address \$33F and BASE+1 refers to address \$340.

Line 17 (LDA BASE) loads the accumulator with the \$00 it finds at address BASE. Line 18 puts this value into page zero location \$FB (PAGE0). Similarly, the value at address BASE+1 is put into location \$FC by lines 19 and 20. The X, Y, and A registers are loaded with their initial values of 31, 0, and 0 in lines 21 through 23. The first statement of the main loop at line 24 decrements the Y register, so Y now contains \$FF.

The main loop of this program uses indirect indexed addressing. This mode of addressing requires that the address to be indexed is stored on page zero. That is the purpose of lines 17 through 20. We have chosen page zero addresses \$FB and \$FC to store the page address of each block as it is cleared. According to page 316 of the PRG, addresses \$FB through \$FE are available to us.

Indirect indexed addressing is among the more complicated addressing modes. Let's examine the instruction in line 25 of the CLRSCR.O listing:

STA (PAGE0),Y

This instruction says to store the contents of the accumulator at the address which is indicated by the contents of the page zero locations PAGE0 and PAGE0+1, as indexed by the Y register. Phew!! Let's try this step by step.

The effective address at which the data in the accumulator is stored is determined through a roundabout sequence of events. First recall that PAGE0 is a label associated with the page zero address \$FB, as defined in line 10. The processor reads the two bytes stored at locations \$FB and \$FC. Initially these will be \$00 and \$20 respectively, as we saw above. These two bytes are interpreted to be the address \$2000. Next, the processor takes the value in the Y register (initially \$FF) and adds it to the \$2000. The effective address is consequently \$20FF. The 0 which is in the accumulator is stored at address \$20FF, thereby clearing that memory location.

According to the table on page 417 of the PRG, the entire sequence just described takes a grand total of 6 microseconds. You can see this by reading across the STA row to the "(Ind.) Y" column. There you see the hexadecimal value (\$91) for this mode of the STA instruction. You also see that the instruction consists of 2 bytes (#) and requires 6 machine cycles (N). Each machine cycle on the Commodore 64 is roughly 1 microsecond (one-millionth of a second). All the address fetching, calculating, and storing described in the previous paragraph takes less than 1/160,000th of a second!

Now that location \$20FF has been cleared, the program continues at line 26. The statement BNE LOOP means "check the zero flag, and if it's not set, jump to the statement labeled LOOP." Let's discuss this concept of flag setting and checking.

FLAG WAVING

The zero flag is one bit inside the processor which is updated whenever certain operations are performed by the processor. The STA instruction does not cause

the zero flag to be updated. This is indicated by the “-” under the Z in the Condition Codes column on page 417 of the *PRG*. This information is repeated in larger letters on page 251 of the *PRG*.

If you look up the DEY instruction on page 242 of the *PRG*, you will see that the N and the Z flags are checked. This means that after the processor performs a DEY instruction, it looks at the result of the operation and sets those two flags accordingly. The N flag is set whenever the most significant bit (MSB) of the result is set. (“Set” means “equal to one.”) The Z flag is set whenever the result of an operation is zero.

The value of Y was initially 0, and the first DEY instruction decremented it to \$FF. Since \$FF is not equal to zero, the Z flag will not be set. (That is to say, it will be reset or cleared.) Consequently, the BNE (“Branch if Not Equal to zero”) instruction sends the processor back to address LOOP. A quasi-BASIC translation of the DEY : BNE LOOP instruction pair might be

```
Y = Y-1 : IF Y<>0 THEN GOTO LOOP
```

Read the description of the BNE instruction on page 238 of the *PRG*. Keep in mind that the state of a flag is determined by the last instruction which affected that flag.

The three instructions in the main loop beginning in line 24 of the CLRSCR.O listing will be executed 255 times, with Y being decremented from 255 to 1 and addresses \$20FF through \$2001 being cleared. On the 256th time that line 24 is executed, Y is decremented to zero, thereby setting the Z flag. Address \$2000 will be cleared, and the conditions for the BNE instruction to branch back to LOOP are not met. Execution continues with line 27.

The page address stored in location PAGE0+1 is incremented from \$20 to \$21. Now addresses \$21FF through \$2100 will be cleared. The X register is decremented in line 28. It is keeping count of the number of pages which still must be cleared. Since X is decremented from 31, the result is 30 and therefore the N flag is not set. The BMI (“Branch on a MINus result”) statement looks at the N flag. Results which have an MSB of one are considered “minus.” Thus \$80 through \$FF (128 through 255) are negatives. \$00 through \$7F (0 through 127) are positives or “plus” results.

Since the N flag is not set, execution continues at line 30. The Z flag is not set (since X was not decremented to 0), and line 30 branches back up to the main loop to clear the next page of memory. A translation of the instructions DEX : BMI DONE : BNE LOOP might be

```
X = X-1 : IF X>127 THEN GOTO DONE
IF X<>0 THEN GOTO LOOP
```

Keep in mind that X is an eight-bit quantity and decrementing it from 0 gives a result of 255.

On the 31st time the DEX in line 28 is executed, the Z flag will be set, since X becomes zero. At this point, the 31 (\$1F) whole pages from \$2000 to \$3EFF have been

cleared. The BMI instruction in line 29 is still bypassed, since X is not negative yet. The BNE in line 30 is also bypassed, since X now equals zero. The Y register is loaded with the number of additional bytes (\$40) to be cleared. The page address has already been incremented to \$3F00 in line 27.

Now as the main loop is repeated, addresses \$3F3F through \$3F00 are filled with zeroes. Line 28 decrements X to \$FF, and the BMI instruction sends the program to its conclusion. The RTS instruction returns control to BASIC.

HOW FAST?

The instructions in the main loop must be executed 8000 times. Is the increase in speed really worth all that we’ve just been through? The results of some simple timing tests are very convincing. Clearing 8000 bytes of RAM in BASIC using a FOR-NEXT loop require 1766 jiffies (sixtieths of a second). This machine language routine clocks in at a grand total of 13 jiffies, and that includes the time required for BASIC to read the object code file into memory from the disk. The routine itself takes only 6 jiffies once it is in memory.

Hard to believe, but true. The machine language program is over 135 times faster than BASIC and nearly 300 times faster if it is already in memory. That’s what makes assembly language worth it all—aside from being an exciting intellectual challenge!

CREATING THE PLOT

We will not go through the second assembly language program in as much detail as the first. The purpose of the second assembly language program is to process the specified values of X and Y and to light the appropriate pixel on the screen. Refer to the PLOT.\$C.S listing for the following discussion.

The BASIC program in Listing 1 POKes values into memory locations XVAL, XVAL+1, and YVAL for X and Y. X is a two byte quantity between 0 and 319. Y is a one byte quantity from 0 to 199. The first task of PLOT.\$C.S is to make sure that the X and Y values are in the proper range. If either is out of range, it is changed to the maximum value.

Beginning at line 43, the program evaluates each term of the expression

$$Z = 320 * \text{INT}(Y/8) + (Y \text{ AND } 7) + 8 * \text{INT}(X/8) + 8192$$

which we saw last month gives the address of the memory cell corresponding to the point (X,Y). Taken a piece at a time, the task is not as formidable as it might seem.

The most difficult problem is to multiply INT(Y/8) by 320. The procedure is to first calculate 8*INT(Y/8) and to multiply that result by 40. Finding 8*INT(Y/8) is simply a matter of dropping off (truncating) the three least significant bits of Y. This is done with the statement in line 52, AND #\$FB. The accumulator contains

the one byte quantity Y. The “#” implies the immediate addressing mode. The processor takes the quantity \$F8 and performs the logical AND function between it and the accumulator’s value, leaving the result of the calculation in the accumulator.

We are using a masking operation here. The three least significant bits of \$F8 are zeroes and the other five bits are ones. ANDing any quantity with zero gives zero while ANDing any quantity with one leaves the quantity unchanged. Consequently, the five most significant bits of Y are unchanged and the three least significant bits become zero by the operation (Y AND \$F8). This is equiv-

alent to the value 8*INT(Y/8).

The result is then multiplied by forty. Multiplication by powers of two is relatively easy in machine language. It amounts to little more than shifting a binary quantity one place to the left. Unfortunately, forty is not an even power of two. It is equal to the sum of two separate powers of two, namely eight and thirty-two. We will use the fact that 40*Z equals (8*Z + 32*Z), where Z presently equals 8*INT(Y/8). The result will be a two byte quantity. The MSB will be in location Z+1 and the LSB will be in location Z.

The ROL (rotate left) instruction in line 61 is used to

rotate the LSB of Z which is in the accumulator. The most significant bit which falls off the left side of the accumulator goes into the carry flag inside the processor. The next ROL is performed directly on memory address Z+1. The carry bit is rotated into the least significant bit position of Z+1, and all the zeroes in Z+1 get shifted one place to the left. Notice that the carry bit was cleared in line 60 before the process was begun.

After three repetitions, Z and Z+1 store a two byte quantity which is eight times its original value. We will use this value later so it is copied into locations Z+2 and Z+3 for safe keeping. Two more repetitions gives thirty-two times the original value of Z and Z+1. Lines 75 and 80 add this quantity to the intermediate values at Z+2 and Z+3 and put the results into Z+2 and Z+3, thus giving forty times the original value of $8 * INT(Y/8)$.

At line 113 of the PLOT.\$C.S listing, the address corresponding to the pixel at location (X,Y) is stored in Z+2 and Z+3 (LSB, MSB). Lines 115-122 calculate the proper bit value (0 through 7) corresponding to that pixel.

The final segment of the program at line 124 shifts a single one into the proper bit position of the accumulator. This result is ORed with the value in the selected bit map memory location, thereby turning on the pixel

at position (X,Y).

Calling this machine language subroutine to calculate and plot each point is still roughly twice as fast as using the BASIC subroutine in lines 400 through 430 of Listing 1 to do the same thing. The program in Listing 1 checks the keyboard buffer index after each point is plotted. The INKEY\$ routine does not work in this bit map graphics mode, so a more fundamental approach was required to interrupt the program. Remember that if the program stops in bit map graphics mode, you can blindly enter GOTO 300 to return the screen to text mode. Once the patterns have been drawn, the program waits for any key to be pressed before returning to normal mode.

The best ways to learn assembly language are to read books and magazine articles about it, study examples of programs written by others, and (most important) get an editor/assembler and use it. Two books that I have found useful are *6502 Software Gourmet Guide & Cookbook* by Robert Findley (Scelbi) and *Programming the 6502* by Rodney Zaks (Sybex).

We will wrap things up with three challenges you might enjoy. First, modify the CLRSCR.O listing so that it fills the color memory (1024 through 2023) with a specified color code in addition to clearing the bit map memory. Second, write a machine language routine to draw a line between endpoints specified by the user. (Perhaps start with horizontal and vertical lines only.)

Third, see how quickly you can analyze this bug that took me a couple of hours to eliminate. Swap the DEY and STA instructions in lines 24 and 25 of CLRSCR.O. LOOP is now the label for the STA instruction. The program still works almost perfectly. In fact, it works fine for 7999 of the 8000 bytes. Can you figure out where it fails?

As a follow-up to the March *Rupert Report* on the DOS Wedge, James Borden (Carlisle, PA) sent the following additions and a correction. To change the disk drive number, type @#d <RETURN> where d is the new drive number (8 or 9). You can pause a directory listing by tapping the space bar. Pressing it again continues the scrolling or pressing <RUN/STOP> stops it. Mr. Borden suggested that after pressing <RUN/STOP>, you may move the cursor up the left column to the line containing the desired filename and type "/", "%", or <up arrow> then <RETURN>. That way you may load and run a program without having to type its name. (You don't have to erase the numbers in the file size column either.) Mr. Borden correctly pointed out that entering LOAD"W":8:RUN will not automatically load and run the program "W". Instead of typing RUN after the colon, you must hold the shift key and press the <RUN/STOP> key. Thanks for the feedback.

Until next month, keep those programs speeding along. Inject a bit of machine language into them. □

BRAINFRAME

An Exercise in Logic for the C-64

By Norm Vogel

Submitted for your approval is a new version of the venerable logic puzzle, *Mastermind* ("MM")™. I wrote the original version of this program when MM first came out, but since the advent of the C-64, it was modified extensively to take advantage of the 64's color and sound capabilities. The result is *Brainframe*—a program which I feel is superior to other versions of this game currently available, and not just another number guessing game.

After the title screen clears, the instructions are printed. The program then prompts for the number of digits to solve (3-5; relatively easy to very hard). When the number has been selected, the game begins.

You input your guess (the RETURN key is not needed—if a mistake is made, hit "R" to redo), then the machine "thinks" about your entry via changing colors and sounds generated by the input. It then prints its evaluation.

During the game, various prompts and sound effects are used; for example, if you haven't gotten the solution

in 10 tries (on a 3-number game), the program displays the message, "You haven't got it YET?!" and gives you a "raspberry."

If the puzzle is solved, "Charge!" is played, along with the answer and number of tries, plus an evaluation of the game, e.g., "Not bad, but you need more practice!" Also shown is a "rating" system whereby you can see, for example, how many games you won in five tries. This display can handle double digits without getting physically larger. It also displays the total number of games played and the number of "give-ups." (If the puzzle is solved in a remarkably short time, the "give-up" count is reduced to zero for the rest of the game.) The game then asks for a replay. (Note: if the "number of digits" is changed, the "rating system" resets itself.) □

PRINTAT

For the C-64

By Simon Edgeworth

This little program simulates the PRINTAT command of some versions of BASIC. It enables you to move the cursor anywhere on the screen with a single command.

The main program (lines 10-18) puts a short machine language program into memory, starting at location 679, and sets the variable AT equal to 679.

The command SYS AT, followed by two numbers, will now move the cursor to any desired location on the screen. For example: SYS AT,8,12: PRINT "MARS" will print "MARS" starting at line 8, column 12. SYSAT, L,C: PRINT "VENUS" will print "VENUS" starting at line L, column C. The demonstration program (lines 20-48) gives more examples of how the command can be used.

To use this utility in your own programs, you only need lines 10-18. Put them at the beginning of your program, and you will be able to use the new command for all of your screen formatting. □

FLOTSAM

Dear Mr. Allikas:

I have become a recent reader of *Ahoy!* I must say that you do an outstanding job as editor in bringing together a variety of informative and practical articles and features. Editorial matter is presented in an interesting manner with clarity and appeal to the eye.

You are to be commended for your many contributions in making *Ahoy!* a most valuable publication for the Commodore user.

Samuel Rabinoff, Principal
P.S. 207, Queens, NY

Ordinarily, we'd be too embarrassed to print such an overwhelmingly positive letter. But what editor could resist a letter from his elementary school principal?

I have been an avid reader of your magazine since your premier issue. I enjoy it very much and get a lot of useful information from it.

One objection I have that I feel should be brought to your attention are the ads from CVC Online that have appeared in the last few issues.

I am not a prude or moralist, but I do not think that a magazine of this quality is enhanced with advertisement of this nature. I am sure that the revenue obtained by accepting advertisement of this sort will be more than lost when circulation decreases due to those that do not care to have advertisement of that type put in the hands of their children.

I am taking the time to write, hopefully to encourage you to maintain the high quality of your magazine including the advertising that most of your subscribers read.

Thank you for your consideration of my observation and comments. I hope to remain a reader and advocate of your magazine.

THE WIZARD OF IM

For the C-64

By Bob Spirko

In a remote corner of the galaxy, the planet Obid is suddenly assailed by a meteor storm. As this ancient planet hurtles through a swarm of rocks, its greatest city, called Im, is threatened with annihilation. A city council is hastily assembled and a decision unanimously struck: send for the Wizard of Im!

You are the Wizard of Im. Brandishing a magic wand that hurls huge fireballs, you set forth to destroy the deadly cascade of rock and spare the city. Despite your powers, however, it remains to be seen if you are quick enough to blast the multitude of menacing meteors before they fall to earth.

The Wizard of Im is a colorful action game that requires lightning reflexes. At first, you'll find it easy to demolish the meteors as they fall from the sky, but in time the speed and number of rocks increases so that you must work frantically to destroy them while at the same time keeping yourself from being struck down.

Since *The Wizard of Im* is written entirely in machine language, you'll need *Flankspeed* to type it in. Run *Flankspeed* (see page 86) and enter the following hexadecimal numbers:

starting address: C000

ending address: C71F

Once entered, save the program on disk or tape. Now reset your computer and type LOAD"WIZARD OF IM",8,1 for disk or LOAD"WIZARD OF IM",1,1 for tape. To start, enter SYS 49152.

The screen will display a brief introduction and then the action begins. Use your joystick to move the wizard left or right, and press the fire button to release a fireball. At the bottom of the screen, your score, lives, level, and best score are displayed. Each meteor that you vaporize will net you a few points or few dozen points, depending on the level that you are on. To your credit, the occasional meteor will disintegrate of its own accord before striking the ground. However, meteors that elude your fireballs and reach the earth will cost you points (except on the first level).

As you progress through the levels, the meteors appear more often and move faster. In time, the screen becomes so congested with hurtling rock that moving the wizard

safely becomes difficult. You'll notice, too, that some levels are more formidable than others. This is because the value of each rock is increased with each level and then reset. This means that some levels will take longer to get through than others, but once through these the next few levels will be quicker.

Like all good wizards, you have three lives. Should you be struck by a meteor you will lose one life. Thrice killed, the action stops and you can start over by pressing any key. During the play itself you can reset the game by pressing f7, or you can exist back to BASIC with f8. To pause at any time press the SHIFT-LOCK key. □

♣ BridgePro® ♠

BridgePro is the first program I've seen that provides a challenge for the average-to-excellent bridge player. . . The documentation is excellent and allows a new bridge player to learn the basics.

—Harvey Bernstein, *Antic Magazine*, Feb. 1985

After having tried three other bridge programs, I find that BridgePro is indeed a pro game. . . It is designed for both the beginner and the advanced player. . . I didn't find anything that could be improved upon.

—Helen Garret, *Apple-Dayton Journal*, March 1985

If you like to play bridge and don't have three other players ever-eager to play, this software is a must. For bridge freaks it's good enough to justify buying a computer. . . Whether you are a "master" or a beginner, this is great software.

PRINT SHOP

The *Print Shop* from Broderbund is a multipurpose graphic utility which turns the Commodore 64 with dot matrix printer into an all-purpose greeting card, banner, and poster

it line on the back (Hallmark, move over).

2. Sign printer—sure to be welcomed by many a small business, as it saves hours with a stencil. These single sheet displays have become all the rage at the local computer fairs and flea markets.

3. Letterhead generator—allows you to create fully illustrated customized stationery.

4. Banner printer.

5. Kaleidoscope generator, complete with bit map screen dump.

GREETING CARDS GALORE

The greeting card generator will most likely be the first part of this package you will try out. As with all the routines, a set of menus takes you through the entire process.

First you may choose one of nine possible borders or none at all. The borders range from simple lines through flowers and lattice work. Next you may choose a graphic image to dress up the card. Fifty pictures and ten patterns are provided on the program disk. The graphics may be selected by number off the handy reference card included with the package. If you cannot bear to tear your eyes from the screen, the program will prompt you with the names of all the prepackaged graphics. If none of the provided graphics suit your taste, a rudimentary graphics editor lets you design your own (more on this later).

If you do select a graphic, you are asked to choose from a small, medium, or large image. If you select one of the smaller sizes you will have the choice of both layout and number of

images. Only one graphic may be used for a given part of the card. The graphics cannot be mixed on the same page of the card. The image may be used only once, or repeated up to 35 times to form a solid back-

ground. Different graphics may be selected for the front and the inside of the card. The large graphic may be printed only once in the center of the card.

One of eight font styles are available for your message. These fonts range from an elaborate Alexia to a simple Block style. Individual text lines can be printed out in one of two sizes using solid, outline, or 3-D lettering with any of the fonts. Fonts cannot be mixed on the same page of the card, although different fonts may be selected for the inside and the front of the card. The more complex styles take up more space, which limits the size of the message. The amount of text available ranges from

The Print Shop cannot actually produce full color graphics like those shown here—Art Director JoAnn Case just could not resist coloring them in. All are reductions of dumps from various Print Shop utilities, including the greeting card generator, the sign printer, and (at bottom of page 51) the banner printer—the original of which is over five feet long.

generator. It is one of the best thought out, easiest to use packages I've come across for the Commodore 64. It is so easy to use, in fact, that I was able to generate my first greeting cards without once referring to the manual. The manual, by the way, is a well-written, 28 page, 8½ x 11" softcover book. It does a thorough job of describing *The Print Shop's* numerous features. To help get you started, the numerous illustrations are a source of inspiration.

WHAT IT DOES

The Print Shop is a collection of integrated programs that will allow your Commodore 64 to perform many of the services heretofore farmed out to your local printery. These consist of:

1. Greeting card generator—turns a sheet of paper into a quarter-folded missive, complete with messages on the front and inside as well as a cred-

By Morton Kevelson

a maximum of 14 lines by 26 characters in the single sized Stencil font to a minimum of 4 lines by 8 characters in the double sized Alexia font. Individual lines may be centered or left or right justified.

The entire creation process is repeated for the inside of the card. The final step is an optional fifty six character credit line for the back of the card.

Actually, there is no need to follow the prompts in the order presented. The program allows for easy movement back and forth through the menus. The only thing to watch out for is the font selection process. If you scroll through any of the larger fonts or change the size of the text lines, any part of the message which no longer fits will be lost even if you reselect a smaller font.

PRINTOUT

The heart of the program is a very

sophisticated print routine which is customized for your specific printer. Two versions of the program are provided. The back of the disk contains the Commodore 1525/MPS-801 version. The front of the disk supports a variety of popular printers including those made by Epson, Star Micronics, Panasonic, C-Itoh, Legend, NEC, Mannesman Tally, Blue Chip, and Okidata. A customizing routine modifies the original program disk, after which a write protect tab should be installed.

The entire 8½ x 11" surface is used for the greeting card. The paper may be precisely positioned by a test routine which advances the paper in 1/72" increments till a dotted line is printed precisely on the perforation. When printing is complete, you simply fold the paper twice to complete the card.

The printout process is rather long, about eight minutes with a Gemini 10X. A colorful animated display lets you know that all is well with the printer, program, and computer. The display message alternates between "thinking" and "printing" while the operation is taking place. Considerable disk access occurs during the printing process, as *The Print Shop* recalls data on the type fonts and graphic images.

SIGNS

The sign utility lets you create a full page sign for just about any announcement. The creation process is very similar to the above. Text space ranges from a maximum of 14 lines by 26 characters to a minimum of 4 lines by 8 characters, depending on font and size.

LETTERHEADS

The letterhead utility lets you design customized stationery. Both a header and a footer can be created. Each consists of a 32 character line in your choice of font with three addi-

tional 63 character text lines. A horizontal separator line may be used to segregate the header or footer from the rest of the page. Graphics may be incorporated in the letterhead design.

BANNER

Need a long sign with eight inch high letters? *The Print Shop* banner utility fills the bill. There is no limit to the length of the message, as repeated applications are possible. This also allows for the mixing of fonts, as well as a variety of graphics on a single banner. Just keep a plentiful supply of printer ribbons and time if you plan to indulge. Roll paper is a definite plus for this application.

BIRTHDAY

GRAPHIC EDITOR

For those finicky souls who cannot find a suitable graphic among the 60 with the package, the graphic editor lets you modify or create your own. This rudimentary utility is a far cry from the sophisticated packages I looked at in the October and November issues of *Ahoy!*, but it does the job. The 88 by 53 dot sketch pad (44 by 45 dots on the 1525/MPS-801

version) occupies about half the screen. Input is accepted from a touch tablet (best), a joystick or trackball (good), or the keyboard (fair). The main problem with keyboard entry is the lack of automatic repeat with the cursor keys.

The editor allows for the placement and removal of dots or clearing of the drawing screen. No other features, such as geometrics, fills, or block moves, are supported. The cursor coordinates are continuously displayed at the bottom of the screen. This will allow you to plot out the entire image on graph paper beforehand. Tracing a picture on a suitably scaled grid might be a good way to start. Graphics may be saved to disk for recall by the other parts of the package. A graphic file only occupies three disk blocks (two disk blocks for the 1525/

WHAT'S NEWS

MPS-801 version). Thus up to 144 graphics, the capacity of the 1541 disk directory, may be stored on a disk.

PRINT SHOP TO BIT MAP CONVERTOR

The graphic editor has its own unique file format for storing the bit mapped image. The *Print Shop to Bit Map Convertor* program on page 88 of this issue will transfer a part of a Commodore 64 standard bit map file into the graphic editor format and vice versa. The program is set up to work with *DOODLE!* files and the non-Commodore *Print Shop* files. When going from *DOODLE!* to *Print Shop*, a small portion is extracted from the upper left hand corner of the *DOODLE!* image. In the opposite direction, the same size image is produced with the addition of a one pixel border. This will allow the extended features of the *DOODLE!* package to be used for the creation of *Print Shop* graphics.

SCREEN MAGIC

This is a unique high resolution bit mapped four quadrant kaleidoscope generator. Two basic patterns are generated. The first pattern has eleven possible variations. Once started, the images vary continuously in an almost hypnotic fashion. When you spot a particularly pleasing pattern, strike the RETURN key to freeze the display.

As with all the other *Print Shop* utilities, a message using any of the fonts may be superimposed on the bit map. Message capacity varies from 8 lines by 22 characters to 2 lines by 6 characters, depending on font and character size. The text may be modified without affecting the original underlying image for as long as you do not save or print the display. Thus, it would be a good idea to save the

image to disk before experimenting with text. The resulting printout fills about a half of a page.

DOODLE! TO SCREEN MAGIC

According to the *Print Shop* manual, the *Screen Magic* images are not compatible with other Commodore graphic packages. Not any longer. Michael Beutjer, author of *Koala Printer*, has provided a program to convert between *Screen Magic* and *DOODLE!* format. This will allow you to color in or print out a *Screen Magic* image with the *DOODLE!* package. The *DOODLE!* screen dump yields an image which is either half the size or twice as large as the *Screen Magic* dump. See the *Screen Magic to DOODLE! Convertor* on page 88 of this issue.

THINGS I WOULD LIKE TO SEE

Several needed enhancements to the *Print Shop* package come to mind. The ability to save a greeting card design would be appreciated. Although the creation process is only a few minutes, being able to recall a saved card would avoid spelling errors and typos.

How about a mail merge utility? This would permit the lengthy printing process to be left as the last step after all your cards have been created. Convenient customization for that truly personal touch could be readily implemented.

A font editor would make a nice enhancement. If nothing else, this would allow the *Print Shop* to "learn" other languages.

Some musical accompaniment would turn the Kaleidoscope utility into a really effective display. Just imagine what the effect of a wall full of displays with the right sound would be like.

Last, but not least, a sophisticated graphic editor would be most appreciated.

CONCLUSIONS

The Print Shop is destined to become one of the most popular packages for the Commodore 64. Its ease of use and wide ranging utility will make it a must-have for most users. The suggested enhancements I have mentioned above in no way detract from the quality of the package as it is presently supplied. I predict that the popularity of this package will lead to many of these features, either directly from Broderbund or from outside sources. □

LUCKY LOTTERY

In light of the money given away every week by the State Lottery Commission, I figured I could increase my chances of picking out the six numbers it would take to pick up the bucks if I had some way of keeping record of the numbers already chosen. Armed only with my trusty C-64 and programming skills, I set out to accomplish this task. After about five weeks of trial, error, and debugging, I finally came up with a finished program that will store all the past lottery numbers which have been chosen, display all possible numbers (depending on state) and the amount of times each has been chosen, and pick out the six numbers which have been most frequently chosen.

Now don't get me wrong, this program will not pick out the six numbers you need to win, but I figure the more information you have about something the more easily you can make an intelligent choice.

Operation of the program is fairly simple. Once past the title screen, you work from a main menu. When first starting your numbers collection, use the #2 selection "ENTER NEW NUMBERS". You will be prompted through the six digits required. The program will then display all 44 numbers. In the beginning a lot of zeroes will show on the screen, but this will change after a few weeks. You will then be asked to press "fl" for the six most common numbers selected. These are the numbers from which you can select your six choices. After the first time you use the program, you must select the first option "LOAD NUMBER FILE" to load the old numbers before you add your latest entries. One more note: always end your program with the #5 selection "END SESSION". This updates your file and ends the program.

Lucky Lottery will only work with a disk drive. I hope you enjoy using it as much as I enjoyed programming it. And please, if any of you hit the lottery using my program, don't forget to cut me in. □

Auto-Append: An Easy Merging Utility for the VIC and 64

By William V. Braun

The thing that I least enjoy about programming is the time I must spend entering in code with the keyboard. I've often wished for some way of adding general subroutines that I had on tape or disk directly to the program I'm working on, rather than having to key them all in by hand. Then there were the times when I wanted to be able to load two programs into memory right from tape or disk and simply combine them into one program. Fortunately, I found a way to solve this problem. If you too have wished for an easy-to-use appending utility, I have the answer for you.

Auto-Append is a short BASIC program which loads a machine language routine into the top 28 bytes of RAM, and resets the limit of BASIC a bit in order to protect the routine from being overwritten. The machine language routine allows the user to enter two programs into RAM directly from tape or disk, then combines them into a single program. You can use *Auto-Append* with any amount of memory expansion, as the program automatically compensates for it.

Just follow these simple steps to append two programs:

1. Load and run *Auto-Append*.
2. Jot down the SYS locations in the instructions.
3. Load the first program (the one with the lower line numbers).
4. Execute the first SYS (type it and press return key).

5. Load the second program (the one with the higher line numbers).

6. Execute second SYS.

Step 2 is very important, as the instructions will gradually scroll off the screen as you load your programs and you will probably have forgotten the proper SYS locations.

It is essential that you keep in mind the fact that the first program you load *must* have lower line numbers than the second program. For example, if the first program ends with line number 800, the second program must begin with a line number no lower than 801. This is necessary due to the way programs are stored in RAM.

Once you have your programs combined, save a copy and verify it before trying to run it. A faulty POKE could cause the program to crash, making it necessary to repeat the appending process if you did not make a copy of the program. Also keep in mind that you must have enough memory (especially important on VIC 20's) to hold the machine language routine and both programs. This is unlikely to be a problem on the C-64; however, on an unexpanded VIC 20 you only have about 3.5K RAM to work with.

Adding your general subroutines (such as centering, rounding, etc.) to a program you are working on can be very easy if you store them on tape or disk as separate programs, then use *Auto-Append* to add them to your new program. You may want to give them meaningful names such as *Center*, *Round*, or *Hex Conversion*. Just load them from tape or disk as needed, using their program name. This technique should be much easier than having a single program with all the general subroutines in it, which would make it necessary for you to delete all the parts of it you did not want after it had been appended to your new program. Don't forget to give the different routines different line numbers, and make sure they are very high numbers to reduce the possibility of having them lower than the highest line number in your new program.

Let's take a look at the program itself. Line 10 is really the workhorse of the program. The first two POKES lower the limit of BASIC by thirty bytes, protecting the machine language routine. Memory locations 55 and 56 are pointers for the end of BASIC. The variable A is the address where the first byte of the machine language routine is to be located. It is also the first SYS address. The FOR-NEXT loop in Line 10 actually reads the machine language routine which is held in the data statements and POKES it into memory.

Lines 15 and 20 clear the screen and print the instructions on how to use *Auto-Append*. The second SYS address is equal to A+19. Line 25 holds the machine language routine executed by the first SYS, while Line 30 holds the second routine.

The first machine language routine moves the start of BASIC to the end of the first program you have loaded, thus causing the second program loaded to be located in memory right after the first. The second machine language routine returns the start of BASIC to its original location. You will notice that if you try a LIST after you have executed the first SYS it will appear that your first program is no longer in memory. This is just because the start of BASIC is now after that program, and a LIST causes the computer to start looking for a program where there is none. The second SYS returns the start of BASIC pointers to their original value, allowing you to see both programs as one. ☐ **SEE PROGRAM LISTING ON PAGE 100**

THE GAMES CREATOR

Mastertronic International

Commodore 64

Disk; \$19.95

Calling all would-be computer game designers. If you've got the ultimate action challenge bottled up inside you, but don't have the know-how to get the idea onto a floppy disk, David and Richard Darling's *The Games Creator* is a "must buy."

Software which lets non-programmers create adventure games and branching stories has become quite common in the last year. Until now, no comparable system has existed for action contests. (Broderbund's *The Arcade Machine*, released in 1983, is easier to use than assembly language or BASIC, but its process is still pretty complex.)

Any reasonably intelligent person can use this program to produce a climbing-and-jumping contest, maze, or scrolling shoot-out with extensive sound and graphics. A sample of each format is included on the disk, and most novices will start by modifying one of these sample games before constructing a new one from scratch. They're also reasonably entertaining in their own right, a bonus for consumers.

The 36-page instruction book reduces the gamemaking process to a series of small, easily understandable steps. The numerous illustrations clarify every phase of the process, even though fuzzy reproduction and sloppy photo cropping undermine the pamphlet's aesthetics. A glossary acquaints users with any unfamiliar design terms.

An onscreen menu, operated with a joystick or the keyboard cursor controls, is the hub of the system. Selecting "Change," as opposed to "Play," "Save," or "Load," begins the construction of a game.

The designer can work on aliens, sounds, graphics, or the player. When one aspect of the game is done, the f7 key restores the main menu so the

gamer can choose another.

Sub-menus regulate the aliens' onscreen motion and behavior characteristics. There are five aliens from which to choose. The inventor can adjust random movement parameters, use the joystick or cursor keys to outline a predetermined movement path, and select the alien's starting position on the screen. The other menu controls animation speed, movement speed, the ability to scroll off the screen, shooting, the mechanism for advancing to higher levels, collisions, and the number of nasties.

Sound is divided into tunes and effects. A serviceable music construc-

tion kit can be used to write up to seven pages of music and make it sound like any of several instruments when played. A program can employ up to seven sound effects to aurally indicate when the player fires a bullet, gets killed, collides with an alien, and so forth. The individual effects can be styled by adjusting the attack, decay, frequency, and waveform. The computerist can check a sound by hitting f1 while working with the effects menu.

Two sub-menus split graphics into scenery and sprites. The former permits the pixel-by-pixel construction of playfields; the latter focuses on the game's moving objects, or sprites, of which there can be up to eight.

The final menu commands the computerist's own onscreen representative. Among the user-determined factors are the player's starting point in the game, the keys which cause movement, how far a character can fall in a jumping game, and whether the player moves continuously or only in response to specific directives.

The obvious question is: What about the resulting games? *Games Creator* programs aren't state-of-the-art stunners, but they can be attractive and a lot of fun to play. The Darling Brothers have streamlined the construction process by restricting choices, especially in sound and graphics, without leeching the life out of it. With practice, an imaginative computerist can invent action programs which would be a credit even to the code-wizards who developed *The Games Creator*.

MICRO LEAGUE BASEBALL

Micro League Sports Association
Commodore 64

Disk; \$39.95

Strike three! The ballgame was over. And even before the Mighty

Casey finished his post-game shower, Mudville rooters were second-guessing the slugger's manager over a round of brews. One secret of baseball's enduring popularity is its endlessly fascinating strategy.

Statistical simulations like *Micro League Baseball* give armchair managers the chance to improve on reality. Their mathematical formulas quantify the performance of major leaguers so that each athlete in the game reflects the real-life player's abilities during the season on which the program is based. So if you teplayed a full season, using each player exactly as his flesh-and-blood manager did, team and individual statistics would virtually duplicate the actual season's totals.

While some players of statistical simulations do, in fact, try to precisely recreate the past, most want to change history. Could a revised pitching rotation improve a team's finish? Is there someone riding the bench who ought to be playing every day? Would the team score more runs if it emphasized the hit-and-run over longball power?

Micro League Baseball gives computerists the chance to answer these and other equally intriguing questions. This is a rock-solid stat game dressed up in visuals which would do any action baseball program proud.

One or two human managers—there's a robot pilot for solitaire fun—can choose any of the 25 famous teams on the Game Disk. The publisher plans Team Disks, available for purchase separately, which will contain many more squads, including all-time all-star rosters for each major league franchise and disks that simulate full seasons. An easy data transfer routine lets the computerist match a team on any *Micro League Baseball* disk with any other team on a similar disk. Thus, it's possible to see how the Yankees of Mantle and Maris might stack up against the Bronx Bombers of Ruth and Gehrig.

The Game Disk contains an anthology of teams, intended to show the scope of the manufacturer's intended future releases. The Game Disk includes some recent juggernauts ('78 Yankees, '80 Phillies, '80 Royals), classic teams of the past ('27 Yankees, '55 Dodgers), and some all-star squads (all-time AL and NL greats). And masochists will thrill to the exploits of the numbingly inept '55 Washington Senators, one reason why there's no team in the nation's capital today.

Each team comes with a suggested lineup. Onscreen menus help a manager switch things around to suit personal preference. The program provides mounds of statistics to aid in the selection process. Won-lost record, games saved, ERA, games pitched, complete games, innings pitched, hits allowed, strikeouts, and walks are listed for all pitchers. The rest of the team members are rated for batting average, home runs, runs batted in, times at bat, hits, doubles, triples, stolen bases, and field average for any positions they can patrol on the field.

The defensive pilot chooses the hurler's delivery from among four possibilities and positions the infielders. They can also call for a pitch-out, order an intentional walk, or visit the mound.

The offensive manager can have the batsman swing away or lay down a surprise bunt. The skipper directs traffic on the basepaths and can order a sacrifice or hit and run.

Players view the action from a seat in the upper deck behind home plate. Small windows indicate who is at bat, on the mound, and in the on-deck circle, while the centerfield scoreboard prints pithy comments as the game progresses. Although the players are drawn small on the screen, wonderfully intricate animation makes their movements easy enough to follow.

Sound effects and music are more than adequate, but they slow down play. Computerists can cut playing time to about 30 minutes by hitting "M" when prompted. This clips the lengthy musical interludes and the admittedly impressive spectacle of having the ballplayers run on and off the field after each half-inning.

Micro League Baseball's flaws are few, but still worth mentioning. The inaugural edition doesn't print a box

score or allow teams to swap players. The company has released a Utility Disk, priced at \$19.95, which adds these functions.

The pitching system has a few kinks. Each throw merely symbolizes one complete interaction between a hitter and pitcher, so it's not realistic to call the hypothetical toss a "curve" or "fastball." Also, many pre-World War II pitchers didn't throw a slider. Perhaps this option on the pitching chart could be made more flexible to allow for a "specialty" pitch like a forkball or knuckler.

Documentation is outstanding. There is a rule book, profiles of all clubs on the Game Disk, and two cards which summarize the keyboard-based order-entry system.

Micro League Baseball is highly recommended for baseball-loving computerists. It provides plenty of mental stimulation and authentic action in an attractive package.

Micro League Sports Association, 28 E. Cleveland Avenue, Newark, DE 19711 (phone: 800-PLAYBAL).

sported a pen that moves only in the x direction, while the paper moves to provide y-axis movement. The Penman is completely different. It features an intelligent base unit connected to a "robot" via a ribbon cable. This robot holds three pens and plots by rolling around on top of the fixed plotting surface.

The Penman is ingeniously engineered. It has two wheels that drive it, and one unrestricted wheel for balance. When initialized, the Penman aligns itself with the edges of the paper by rolling toward the edge until its bottom optical sensors detect a contrast difference between the paper and background; then it backs up, turns, and seeks the other edge. All this is purely fascinating to watch.

The Penman can be told to plot in

two ways: by Cartesian coordinates or polar coordinates. Plotting each way is very simple. The plotter is simply given a set of coordinates, or a direction and distance. Smooth circles are drawn in polar mode by giving a curvature parameter. An additional robotics mode gives you direct access to the drive motors and optical sensors for more direct control of the robot unit. A standard character set is also built into the plotter. Text can be plotted at various sizes and angles with ease.

Interestingly enough, all lines, circles, and shapes drawn by the Penman are completely smooth, in contrast to the stepped lines drawn by other inexpensive plotters. This is due to the fact that the Penman draws by continuously varying the speed of its

two drive motors to produce smooth plots. Another interesting feature of the Penman is its ability to "unwrap" itself automatically from the connecting cable.

The only gripe I have with the Penman is that on complex plots accuracy is lost. One way around this is to have the robot realign itself every so many moves, but this takes time.

The Penman interfaces through any RS232 port and is driven by standard ASCII commands. At a price of \$399, it is a surprising value in a low cost plotter.

As the System Operator (SYSOP) of this magazine's bulletin board service (BBS) and longtime SYSOP of my own BBS, I have spent a great deal of time examining the BBS software currently available for the Commodore 64. With the wide variety of BBS's now in use, choosing the software that offers the best value for your money is not simply a matter of buying the most expensive you can find. Fortunately, Vision Software has recently released an outstanding entry into the marketplace.

Vision BBS V8.3 offers all the features you would expect of a good BBS, combined with a price tag that won't destroy your budget. With features such as new style Punter up and downloads, up to 99 different message bases, and a userlog that can hold up to 999 users, plus the ability to work with as many as five drives, this software is a joy to use. Though the clear, well-written documentation claims a setup time of 1 hour, those of you who are new to bulletin boards should allow a little extra time to plan out the many different menus that must be written.

Once the various menu files have been created, the BBS is ready to go online. The first user entered should naturally be the SYSOP, and subse-

quent users are added to the userlog as they call in. Each user is required to choose an 8-digit password and is assigned a user code as well. New users may be given a low access level until the SYSOP has time to examine their application, whereupon their security level can be raised to allow them access to more features on the BBS. Security levels can range from a low of 1 to a high of 99.

One especially useful feature of this software is the ability of the SYSOP, and selected users, to control the operation of the BBS from a remote terminal. By selective use of high access levels, the SYSOP can allow various users to log on and control individual areas of the BBS from their homes. This reduces the amount of time the SYSOP must spend maintaining the BBS and updating the files.

Another very interesting function of this program is that it can also be used as a terminal program, allowing the SYSOP to log on to other BBS's to trade files and information without the need to load in a different program. This feature alone is, in my opinion, worth half the cost of the software.

One drawback that I noted while setting up my preliminary copy of the BBS is the lack of a text editor, which is required to generate the various menus used. A quick call to the manufacturer brought swift assurances that all future versions will include not only a text editor but a timing system that will remove the BBS from the phone line at a predetermined time if you choose to run your BBS on limited hours.

Persons interested in viewing this software before buying may call the *Ahoy! BBS* at (718) 383-8909, 24 hours a day, 7 days a week.

The current price for the software is \$69.95, and registered owners can purchase a backup copy for an additional \$10.00. Future updates will also be made available to registered owners at a cost of \$25.00. More information may be obtained by calling the Docs 'R' Us BBS at (914) 668-3664, or by writing the manufacturer at the address given below.

When ordering, please specify which type of modem you plan to use. There is a \$10.00 charge to change modem types at a later date.

SOUNDCHASER 64

Passport Designs, Inc.

Commodore 64

\$199.00

At first glance, the Soundchaser 64 musical keyboard appears to be first rate. Unfortunately, the supplied software doesn't enable the keyboard to live up to the expectations set by its appearance.

To start on the positive side, the

keyboard is a full-sized 4-octave unit with an excellent feel. The housing is attractive tan plastic, matching the Commodore. Connection to the computer is made via a ribbon cable to the cartridge port. Overall, this is one of the finest keyboards I have encountered.

The *BASIC Synthesizer Software* provided includes a monophonic and a polyphonic synthesizer. The monophonic package is reasonably good; it allows all oscillators to play in unison, producing a very 'fat' sound. Additionally, there is a LFO (low frequency oscillator) that can be used to produce vibrato and other special effects. Thirteen presets, which can be modified at will, are included. They are good, but I was able to improve on most of them through the included sound editor.

The polyphonic synthesizer allows you to play the keyboard with up to three notes pressed at once. Six presets are included; they are fair, none being very impressive. The limitation on the presets is caused by the lack of any special features as found on the monophonic package.

Neither package makes any provision to 'record' in any way. Modified presets cannot be saved to disk, and the mono/poly programs are separate and not directly accessible from one another. Fortunately, Passport told us that they will release versions of *Macmusic* and *Computer Sheet Music* that will take advantage of the

VIZASTAR INFORMATION PROCESSOR

Solid State Software

Commodore 64

Cartridge and disk; \$119.97 or \$149.97 (see below)

"Innovative," "awesomely powerful," "sorely needed," and "incredible guarantee" are phrases I immediately associate with *VizaStar*. These words aptly summarize this unique "work processor." Other apropos descriptors: "humongous cell capacity," "impressive graphics," "multiple windowing," and "easy-to-use;" the list goes on and on, but you have the idea: this is a program unlike anything else for the C-64!

VizaStar is an integrated software package; that is, it consists of three programs that work interactively. Residing simultaneously in memory, the spreadsheet, database, and business

graphics programs are always immediately available. Each is outstanding in its own right. By integrating their features, Solid State Software has provided tremendous capabilities for information handling on the C-64. The only comparable product would be *Lotus 1-2-3* for the IBM PC; nothing in the C-64 world comes close to the vertical integration features of *VizaStar*.

The terms information processor and work processor, used by Solid State, describe not only what *VizaStar* is, but what it does.

All functions and applications for the program are menu-driven, and selections are supported by sub-menus. The basic display consists of a worksheet grid, and all labels, data, formulae, etc. are entered on it. Multiple windowing capability (up to 9 windows "open" at a time) allows viewing several portions of the worksheet simultaneously for comparison or reference purposes.

The program will support most popular printers suitably interfaced. Although a printer isn't mandatory to use *VizaStar*, it certainly is desirable. As of this writing (4/25), only the 1541 Disk Drive is supported.

The spreadsheet grid is a matrix of 1000 rows and 64 columns, yielding a maximum capacity of 64,000 cells! Cell formatting either individually or globally is provided in currency, scientific, date, left- or right-justified, centered, integer, and general purpose formats. Additionally, they can be globally or individually protected from modification.

Built-in functions for use in formulae include date processing and date calculations, in addition to the normal + - * / mathematical operators. The date functions are extremely useful and can be used for schedule planning, invoicing, "time-stamping" data, and multitudes of other applications. The built-in functions consist of:

CALENDAR: @date, @day, @month, @year, @today

LOGICAL: @false, @true, @isna, @iserr, @if, @err, @na, and, or, not

MATHEMATICAL: @abs, @cos, @exp, @int, @log, @round,

@sin, @sqrt, @tan, @pi

STATISTICAL: @avg, @count, @max, @min, @sum

TABLE LOOK-UP: @hlookup, @vlookup

A very powerful feature of *VizaStar* is the automatic keyboard "EXEC" facility. This allows you to set up a sequence of commands which can be executed at any time, further expanding the program's range of complex applications.

Database operations are called up from the worksheet, and a collection of up to 15 indexed files is possible. Each file holds records which can be up to 8,000 characters in length. The records may contain up to 64 different fields, and the fields can be up to 120 characters long. The average disk access time for any random record is three seconds on the 1541, fast enough to be envied by some "dedicated" database programs.

Database file layouts are easily configured on a blank screen and reversed headings and borders are possible. You can include up to nine screens per file layout, more than sufficient for just about any application.

All database processing is direct in the program, and search criteria may be combined if desired. Search operators include:

*—wild card match

?—individual character position match

&—match if following characters are found

<—less than match

>—greater than match

<—ignore/do not match

Business graphics functions allow translating spreadsheet/database information into line and bar graphs, and windowing is permitted and supported in this mode as well. Additionally, the XGP (Extended Graphics Package) is included with the program, which provides two impressive and sophisticated graph modes—color "pie charts" and 3-D, 4-way-scrolling "skyscraper" graphs. These graphing formats are the best I've seen yet for the C-64, bar none.

The XGP graphs (pie & skyscraper) may be labeled and printed out directly on a Commodore MPS 801 or

Epson-compatible printer with suitable interface. Line and bar graphs are supported on almost all popular printers suitably interfaced. The printer functions will also support printing reports and labels.

VizaStar is extremely fast in terms of records access speed and overall operation due to the fact that it is written in 100% 6502 Machine Language. It is compatible with most word processors for the 64.

The *VizaStar* software resides both on cartridge and disk; the cartridge must be inserted while using the program. Two copies of the program disk are provided. In addition, a Tutorial Guide manual and a spiral-bound User Reference Guide manual are included, all inside a partitioned vinyl case that provides convenient and durable storage. Rarely do you find documentation equal to the caliber of the software it pertains to. *VizaStar* gets a solid 4-star rating in this department.

VizaStar has a retail price of \$119.97 (version XL4; see below), not expensive when you consider that a good database will cost you about \$100, as will a spreadsheet with decent graph capability, but not a small piece of change, either. Solid State Software is so confident in the product that they offer a full refund for any reason by returning it to the place of purchase within 15 days. After using *VizaStar*, I predict that Solid State will have very few refunds to make.

Though it's an incredibly powerful piece of integrated software, I found *VizaStar* quite simple to use, thanks to the excellent tutorial and reference manuals. The onscreen menus and sub-menus present the program options and functions in a clear, logical manner. Learning to use *VizaStar* is painlessly accomplished by following the tutorial guide and entering the examples. Unique features like the EXEC facility make it possible for novices to set up and execute complex command sequences.

Owing to the far-ranging capabilities of the program, it can be used for all sorts of applications. I found it particularly well suited for planning, projecting, visual analysis of

data, scheduling, maintaining customer records, mailing lists, generating reports, and other information-handling tasks. I'm sure that the useful applications of *VizaStar* are limited only by the user's imagination.

If you're looking for a serious application program to handle your spreadsheet, database, and business graphics tasks, your search has ended.

VizaStar does it all, and does it all amazingly well.

(*VizaStar* is available in two versions: the standard XL4 with 10K of free RAM (\$119.97) and the XL8 with 14K of free RAM (\$149.97).)

"Just let me hear some of that rock & roll music, any old way you choose it."

Any old way? Chuck Berry might have had a few second thoughts if he had anticipated the invention of the home computer. Thirty years after those words were written, rock and roll has transcended the world of electric guitars and drums and entered to world of microprocessors. One of the first examples of this phenomenon to reach the marketplace is Sight & Sound's new "computer song albums."

It was only a matter of time before somebody figured—"Kids love rock, kids love computers, the C-64 has tremendous musical capabilities, so let's turn some rock songs into computer-generated music."

That's exactly what they've done. *On Stage* and *Music Video Hits* are essentially collections of recent popular songs translated for computers. *Music Video Hits* includes *Thriller*, *Let's Hear It for the Boy*, *Sweet Dreams*, *Break My Stride*, *Steppin' Out*, *Soul Man*, *Classical Gas*, and *The Hustle*. *On Stage* features *On the Road Again*, *Ease Down the Road*, *Rise*, *Duelling Banjos*, *Cantina Band* (from *Star Wars*), *Entertainment Tonight*, *Charlie's Angels*, and *Far from Over*.

As the Commodore's SID chip pumps out the music, the "sheet music" appears onscreen. Notes don't scroll by, they sort of flash on and off in musical phrases. After a three-note phrase is finished, the notes disappear and get replaced by the next three. At the bottom of the screen you see the words to each musical phrase, as well as the words to the next phrase.

The music itself has been competently programmed by Peter Engelbrite. Each of the Commodore's three voices can be distinctly heard, which is intriguing to listen to. With most rock music, it's very difficult to sep-

arate the various instruments in your head.

Synthesizers are adding a new dimension to music, as is obvious from recent songs by Herbie Hancock, Thomas Dolby, The Eurhythmics, and others. But simply taking a song and synthesizing it is not necessarily an improvement. Just the opposite, in fact. Digitized *Thriller* is interesting at first, but after a few minutes you get the distinct feeling that you're on an amusement park carousel ride. The music is machinelike, automatic. The human emotion is missing. It's the Muzak-rock of the 1980's.

Whenever we complain about computer-generated *anything*, we can usually add, "But this is more than compensated for by the computer's ability to *interact* with the user." Unfortunately, this isn't the case with Sight & Sound's computer song albums. Hitting the number keys on the top row *will* speed the music up and slow it down. Manipulating the joystick *will* slightly change the "instruments" and create "special effects." But the interaction is minimal. You can't edit the notes to *Soul Man* and add a few licks of your own.

Sight & Sound *does* make two other programs—*The Music Processor* and *The Music Video Kit*—which are compatible and allow more creativity when combined with the computer song albums. Both are sold separately. But if you buy the computer song albums alone, you're basically just getting rehashed rock, at *four* times the cost of a regular album by the original artist.

You've got to *really* like computer music to go for a deal like that. Sight & Sound's selection of songs certainly doesn't make it easy. Admittedly, there are some good tunes here, but each disk is a random hodgepodge of musical styles that is guaranteed to please nobody. Do fans of Joe Jackson's *Steppin' Out* really want to hear *The Hustle*...or vice versa? Willie Nelson fans will certainly get into *On the Road Again*, but do they care about *Ease on Down the Road*? Mason Williams' *Classical Gas* is a good song, but get hip, gang—it's 17 years

old! And why anyone would *ever* want to hear computerized renditions of the themes from *Entertainment Tonight* or *Charlie's Angels* defies the imagination. Even *K-Tel* wouldn't release an album with selections like these. It seems as though Sight & Sound just threw on any songs that were available to license.

The heart of rock and roll is still beating, but not on floppies. Real music lovers should stick with the real thing.

But real music lovers *may* be interested in another disk made by Sight & Sound—*3001 Sound Odyssey*. Many of us are familiar with terms like volume, pitch, waveform, and envelope. These are the physics of sound that make, for example, a trumpet sound different from a piano. Though you may have *heard* of all these terms, chances are you don't fully understand them. Dictionary definitions don't help much when it comes to vague, non-visual concepts.

If only we could manipulate waveform or envelope *ourselves* these concepts would become clear. The computer is the perfect medium to actively experiment with the physics of sound. *3001* isn't a music program like *Music Construction Set* or *Musicalc*. It's a synthesizer that teaches you and shows you how to play with the parameters of sound. The program includes an excellent tutorial that explains all the terms and provides examples of each. After each section, you can get a "Show Me" or a "Try Me" demonstration.

Once you learn the difference between "modulation" and "pulsewidth," switch to the "microsynth" mode and go crazy. A tap of the joystick lets you turn the Commodore's three voices on and off, play with filters and modulation, and manipulate all the elements of sound. Change the waveform from "sawtooth" to "pulse" and see what happens. The top two rows on your keyboard form a mini-piano keyboard that will let you create an unlimited number of sounds, from beautiful music to awful noise. If you're interested at all in the creation

of music and sound effects, you'll find *3001 Sound Odyssey* an educational and fascinating experience.

Including *Squares* Game for the 64

By Roger S. Macomber

Professor of Chemistry
University of Cincinnati

Probably all of us have, at some time or another, played with Ohio Art's "Etch-a-Sketch." The *Etch* program described here allows you to create similar pictures on your Commodore monitor, but with several additional features. And perhaps most important, it allows you to print the screen image on your printer. (The printing feature was written for a Gemini 10 or 10X printer; use with other printers will require some modification to the program.)

Screen Dumping on the Commodore 64, in the June '85 *Ahoy!*, introduced the principles of screen and printer bit graphics, and demonstrated how to transform a screen bit map into one accessible by an 8-pin dot matrix printer. Readers interested in the details of bit map creation should consult that article. The present program uses similar machine code routines for memory manipulations and printing. But the bulk of the program is written in BASIC and can be readily understood.

To get the program running, here is what you need to do:

1) Move the beginning of your BASIC program with the following instruction: POKE 44, 64 : POKE 16384, 0 : NEW.

2) Enter the program, instructions 1-1190, as it appears on page 97.

3) PEEK in 45 and 46 to determine the location of the end of your program, then POKE in a value 210 greater to accommodate the machine code. (See Part I last month.)

4) RUN the program, and input the 207 bytes of machine code listed at the end of the program. Do this slowly and carefully.*

5) Delete instruction 4.

6) SAVE the program, then RUN it.

*If you should ever want to list the machine code at the end of your program, use the following sequence:

```
4 OPEN 4,4,2 :CMD4 :J=0
5 FOR I = 0 TO 206:PRINT PEEK(S1+I);:J=J+1
6 IF J>15 THEN PRINT CHR$(10);:J=0
7 NEXT:PRINT#4,:CLOSE4:STOP
```

We'll describe the game later, so answer "N" to the first query. You should see a white screen (blue borders), and if you look very carefully at the upper left corner, you'll see one black dot indicating the position of your cursor. You can move this cursor up, down, right, or left using the normal cursor control keys. Notice as you practice moving the cursor that it is prevented from going off the screen. If you press F (Fast) the cursor will move 5 times as fast; pressing S (Slow) will restore the slower movement.

Now, to draw a horizontal or vertical line, press D (Draw) and your cursor will leave a line behind it as it traverses the screen. (When using the Draw function you must continue one dot past the end of the desired line, because the last dot is erased when the draw mode is disabled.) To disable the Draw function, hit D again. Note that if you engage D in

Shown: a reduction of an actual dot matrix printout of a game of *Squares*.

the F mode, you will draw a dotted line, while in the S mode, a solid line results. If you make a mistake, you have two options. First, pressing E puts you in the Erase mode and the cursor will erase any dot it crosses. So by retracing the offending line you'll see it disappear. The Erase mode is disabled by pressing E again. Or second, by pressing f7, the entire screen is cleared to begin anew.

One further feature of the program allows you to draw straight lines at any angle to the horizontal. To draw such a line, bring your cursor to one end of the desired line and press I (Initial), then move your cursor to the other end of the line (anywhere else on the screen except directly above or below the initial point) and press D (Draw) L (Line). Immediately a line is drawn from the final point back to the initial point. Notice also that the D, E and L functions all operate in either the F or S mode.

Finally, when you have created just the picture you want, you can print it (on a Gemini 10 or 10X only!) by simply pressing fl.

SQUARES GAME

Let's return to the game as promised. To do this, it will be necessary to hold down the RUN/STOP key and press RESTORE, then RUN the program again. This time answer "Y" to the prompt. The screen will fill with a 10 dot x 10 dot array, and the cursor dot will appear near the middle of the screen. By using your cursor controls and the Draw function, each player alternates and tries to complete squares in the usual way. When a square is completed, the player identifies it with some number of dots in its middle. The player with the greatest number of squares wins. The printed result of one such game is shown here; the author lost! □

The Intelligent alternative to overpriced 64™ software

The Intelligent Software Package for C-64™, VIC™, SX-64™, C-128™, LCD™, Plus 4™, 16™, B-128™, and PET/CBM™. An integrated home/business/educational package of 25 powerful, useful programs (totaling over 51 pages of source code) that will put your Commodore to work right now, in your home or office; all on disk or tape at the ridiculous price of \$35, or about \$1.40/program. One customer writes: "... This is as slick a deal as I have seen and more than adequate for all except fancy presentations. The best thing is the ease of use ..." The package includes:

Database: A complete multi-keyed fixed-record-length data base manager. Sort or select (using all relational operators: =, >, <, AND, OR, NOT, wild card) on any field, perform computations on numeric fields. Any operation can be performed on all, or only selected records. All fields completely user-definable. Can be used for any number of tasks, including accounting, mailing lists, inventory control, record, tape, or book cataloging, expense account maintenance, or as an electronic rolodex. Even if you use your Commodore for nothing else, this program alone might justify its expense.

Word Processor: A full-featured menu-driven word processor including: very fast file commands, screen editing, text locating and full control over margins, spacing, paging, indentation, and justification ... well done and highly functional ... Provides an excellent alternative to the high priced word processors ... this is an excellent buy. Highly recommended — Midnite Software Gazette. "Provides good basic features." — Compute's Gazette.

Copycalc: An electronic spreadsheet. Turns your Commodore into a visible balance sheet, includes screen editor. "Excellent program for budgeting, estimating, or any math-oriented use ... well worth the money. Highly recommended." — Midnite Software Gazette.

Also included: **ReportGen, ReportMerge** (interface W/P with Database to create form letters, statements, invoices, mailing labels, other reports); **Baseball Statistician** (compiles batting statistics for a baseball league); several W/P utilities, including **Index** (indexes W/P's text files); several Database utilities, including **DBmerge** (facilitates multi-file database applications), and **DBStat** (analyzes D/B files); a programming utility, **ASCII**, which converts text files (program listings) into program files; also **Checkbook, Inventory, Paper Route, Loan Analysis, Breakeven Analysis, Depreciation, Labeler, File Copier**, more.

Versions of the package are available for every Commodore computer having a minimum of 10K RAM, please specify regular disk, 8050 disk, or tape format (disk only for Plus4™ and 16™.) All programs support tape, disk, and printer; price includes documentation and shipping. Calif. residents add 6%. Visa/Mastercard, add \$2, no personal checks from outside USA. This ad is the catalog, a sampling of program output is available for \$2.

Is there any way to suppress the six line perforation skip on the Okimate 10 printer? I have tried changing my printer and interface without any results. I can control the problem with *WordPro 3 Plus/64* by setting the page length to 60 for eleven inch paper. This cannot be done with my *General Ledger Accounts* program from Integrated Software Series (ISI). I have also tried every possible way to access the printer's other text modes from within *WordPro*, but nothing seems to work.

—George Elder
Cornelius, OR

George,

Hold everything. Stop changing hardware with your dealer. There is nothing wrong with your printer or its interface. The Okimate 10 powers up with the perforation skip feature activated. This is described on page 11 of the manual. The manual does not explain how to turn this feature off or on. However, the appropriate command codes are listed in the Command Reference Chart located on the inside back cover. To turn off the automatic perforation skip for use with any of the programs you mentioned, simply execute the following commands prior to running the program:

```
OPEN 4,4
PRINT#4,CHR$(27)CHR$(66)
CLOSE4
```

To turn the perforation skip back on, change the second line to:

```
PRINT#4,CHR$(27)CHR$(65)
```

These commands can be issued in immediate mode as shown, or they can be SAVED and RUN as a short program by including line numbers.

The difficulty with accessing the Okimate 10 special features from within *WordPro* is not a problem with the Okimate 10 printer, but apparently a limitation of *WordPro*. Page 9-6 of the manual indicates that the ability to send special characters in CBM mode is limited to a value of 254. In addition, according to the manual for the Tymac printer interface, *WordPro* disables the special character mode when the "C" option is selected in response to the "Printer?" prompt. As a result, we must conclude that you will not be able to access any of the special features through *WordPro 3 Plus*.

I own an MX-80 Epson printer with an 8145 RS232 interface card installed to an HP computer via RS232. I would now like to interface the same printer (without

AUTOS: LEASING V. BUYING

For the C-64

By Gil Ragan

Since I had not purchased a new car for several years, the celestial sticker prices came as a complete shock. The high monthly payments and steep interest rates were much more than I had anticipated. The salesman, noting my reaction, urged me to consider leasing. He argued that leasing was actually cheaper than buying. However, I wondered whether his claim was true. Would it be cheaper to lease a new car than buy it?

I struggled with my hand calculator for several long hours before realizing that the problem was far too complex for a few simple calculations. Each auto had a different price and, consequently, a different monthly payment schedule. And there were so many lease plans available. Finally, I turned to my Commodore 64 to find a systematic and thorough way to make the desired comparisons. The result is this *Leasing v. Buying* program. Even if you're not in the market for a new car, you may find this program educational and interesting to run.

The program produces tables showing the cost of owning a new car and the cost of leasing the same car. It tells you what information you need, makes the necessary calculations, and displays the results so you can decide whether it is better to lease or buy in your specific situation. The program can be run over and over so you can easily compare different makes, models, optional equipment configurations, and financing arrangements with their respective lease plans. Although designed for screen display, the program can be modified easily to output to a printer if you wish to study the results.

TYPES OF LEASES

Despite the wide variety of names used, there are basically two types of leases available: closed-end and open-end. Under a closed-end lease, the monthly payments you make are for a specific period of time. When the lease period ends, you return the car and you have no additional financial obligation to the lessor.

Under open-end leases, you agree to pay an additional amount if the value of the car at the end of the lease period is less than the amount estimated at the time the lease is signed. For example, suppose the lessor estimates that the car will be worth \$3,850 at the end of the lease period. If its value at that time is only \$3,300, you would have to pay the balance of \$550. However, if it is worth more than \$3,850, you should receive a refund.

This program may be used for both types of leases. However, most leases have a limit on the number of miles you are permitted to drive each year, usually around 15,000. If you exceed this limit, you will have to pay an additional charge for the excess miles. The program assumes that you will stay within the miles limit.

ENTERING THE INFORMATION

After copying the program, type RUN and enter the information requested. Most of the requests are self-explanatory. However, a few words are necessary to insure accurate inputs. Naturally, the buying and lease information should be for the same make and model car in order to produce a meaningful comparison.

The purchase price is the first item requested. For this entry, use the actual price the dealer would be willing to accept, not the manufacturer's suggested retail price. When entering dollar figures, do not use \$ or commas. Next you will be asked, WILL YOU NEED FINANCING? Type in a 'Y' if you expect to borrow part of the purchase money. An 'N' will cause the program to branch and skip the questions relating to loans.

For the interest rate request, enter any fractional portion of the rate as a decimal. For example, 15 1/4 percent should be entered as 15.25. The length of the loan should be entered in months. A four-year loan, for example, should be entered simply as 48 for 48 months. Inputting the length of the loan this way lets the program calculate your monthly loan payments and interest charges. These calculations are made in lines 1030 and 1040.

If you live in a state that imposes a sales tax on autos, enter your state's rate when requested. Don't forget to enter the percentage rate in decimal form. The sales tax in dollars will be computed automatically. For the license fee request, enter your best estimate if you do not know the actual amount.

You are next asked what type of car you are considering. The reason for this request is that cars depreciate in value at

different rates depending upon their types. Average depreciation rates for the three major types of cars are stored in the subroutine in lines 2000-2220. The number you enter here will select the proper group of rates for the type of car you are considering.

One ownership savings frequently overlooked stems from the federal income tax. Interest charges on loans and state sales taxes paid are deductible for tax purposes if you itemize your deductions as opposed to taking the standard deduction (now called zero bracket amount). If you itemize, answer 'Y' to the question posed. This will be followed by a request for your percentage income tax bracket. You can find your income tax bracket by using the X, Y, Z Tables in the income tax booklet which is sent to you with your tax forms each year.

The next section of the program will ask you to enter data about the lease you are considering. First, you will be asked to enter the amount of any refundable security deposit you are required to make. This will be followed by a request to enter the amount of the monthly lease payments. Include only the cost of the "pure" lease. If a service maintenance contract is included with your lease package, the cost of this contract should be subtracted to get the actual lease cost.

Some leases require a non-refundable down payment or other charge at the beginning of the lease. If such a payment is required, enter the amount as requested.

THE RESULTS

After all information has been entered, the program will first compute your net cost of buying and will display the results on the monitor. The display format will vary depending upon whether you pay cash or finance the purchase, and upon whether you itemize deductions for income tax purposes or not.

THE CARTRIDGE BACKUP SYSTEM FOR THE COMMODORE 64®

The SOLUTION to all of your cartridge problems is the Cartridge Back-Up System (CBUS) for the Commodore 64.

The **CARTRIDGE BACK-UP SYSTEM (CBUS)** consists of two hardware components and very friendly software on a diskette.

The two hardware components are:

1. **CBUS-I** — the "SNAPSHOTTER" that takes electronic pictures of cartridge software and stores them on disk. Our **CBUS "AUTOSAVER"** permits anyone to do this automatically.
2. **CBUS-II** — is a true cartridge emulator. The unique **CBUS-II** (patent pending) permits you to run all standard cartridge software stored on disk by use of **CBUS-I** or equal.

A **CBUS SOURCE DISK** is provided. This contains very friendly software. The **CBUS AUTOSAVER** permits anyone to automatically copy cartridge software to disk and also updates the Directory. The cartridge software (on disk) can be selected from the **CBUS** menu using the keyboard or joystick. Programming knowledge is NOT required, however, a comprehensive set of manuals are provided for those who want to know how it works.

CBUS is the only system which permits the storing of ALL standard cartridge software designed for the Commodore 64 on disk and running software from disk. **CBUS** does NOT "crack" the software. The unique **CBUS-II** can emulate all of the standard cartridges, thus the software runs the same as in the original cartridge.

If you do not need to finance your purchase, you will see an item called "Interest lost on purchase price." This item refers to the interest your money could have earned at bank passbook rates had you not bought the car. The interest you give up by spending your funds is one of the hidden costs of ownership. Incidentally, if you have been earning a higher interest rate on your money, insert that rate in line 1015 in place of the .055.

If you finance the purchase, you will see a similar item "Interest lost on down payment" instead. The same reasoning applies to this cost of ownership. The bank passbook rate is in line 1020, and a higher rate can be easily substituted. For financed purchases, an additional line called "Total Payments on Loan" will be displayed. This line shows the total interest charges and loan repayments on the portion of the loan used to purchase the car only. Additional money borrowed for things like the license is excluded to avoid double counting.

Next you will see some deductions. The car you buy should have a value at the end of the loan or lease period. This residual value is an estimate of the amount you should be able to obtain by selling or trading the car at that time. Consequently, it must be deducted to obtain your net cost of buying.

If you itemize your deductions for income tax purposes, the tax savings is computed and also deducted from the total cost of buying to give your net cost.

The program will then compute the cost of leasing. Press 'C' to view the results. Again, note that interest lost on the security deposit and on the non-refundable down payment is computed and added to your cost of leasing. The security deposit will be refunded to you at the end of the lease period, so it is deducted to find your net cost of leasing.

Note that items such as insurance, repairs, maintenance, gas, and oil have been omitted. Under the standard lease, you must pay for these items just as you would as an owner. These items, then, would be the same in both calculations. For this reason, they are ignored, and the program concentrates only on items likely to be different depending on whether you lease or buy.

THE FINAL COMPARISON

Press 'C' once more for a final display. First, you will see what your monthly loan payments will be. This is followed by the monthly lease payment which you entered. Don't be surprised to find that the monthly loan payments are higher than the lease payments. Such a situation will happen particularly if you are making a rather low down payment. This is what the salesmen mean when they imply that leasing is cheaper than buying.

The key comparison is found in the next two lines. They show your net cost of buying and your net cost of leasing. The final line of the program will tell you whether it is cheaper to lease or buy based upon the information you entered.

PRINTER MODIFICATIONS

One final note. If you wish to modify this program to output to a printer, delete lines 520 and 540. These lines merely introduce stops in the screen display. Then, for a VIC-1525 printer, add the following:

```
490 OPEN 2,4
500 CMD 2
750 PRINT#2: CLOSE 2
```

If you have a different printer, consult your manual for the appropriate OPEN, PRINT, and CLOSE statements. □

COMMODORE ROOTS

WRITING & RUNNING AN ASSEMBLY LANGUAGE PROGRAM

By Mark Andrews

Writing a program in assembly language requires a software package called an assembler-editor, or simply an assembler. Three of the most popular assemblers for the Commodore 64 are:

- The *Commodore 64 Macro Assembler Development System*, manufactured by Commodore.
- The *Merlin 64* assembler, manufactured by Roger Wagner Publishing, Inc. (formerly Southwestern Data Systems) of Santee, CA.
- The *Panther C-64* assembler, manufactured by Panther Computer Corporation of Los Angeles.

It wouldn't be fair to rate these in 1-2-3 order, since each has its advantages and disadvantages. But to help you decide which you'd like to use, here are brief descriptions of each:

THE COMMODORE 64 ASSEMBLER

An excellent package, designed by professionals for professionals, the *Commodore 64 Macro Assembler Development System* (the *Commodore 64 Assembler* for short) works much like the large assemblers used with mainframes. Unfortunately, though, it isn't what I'd call user-friendly; in fact, it can be downright user-hostile, especially for people who are just starting to study assembly language.

The *Commodore 64 Assembler* comes on a single 5¼-inch disk. But there are several programs on that disk, and each time you write and assemble a program, you have to load and run several individual utilities—in the correct order. If you use the programs in the wrong sequence, or make a mistake in using one program before you load the next one, you sometimes have to start the process all over again. That can be both annoying and time-consuming.

THE MERLIN 64

The *Merlin 64* is an imaginatively designed assembler with a host of advanced features—some not available in any other C-64-compatible assembler system. For example, *Merlin* comes with a very sophisticated disassembler (a utility that can convert machine language into assembly language). Another bonus is a large library of useful assembly language routines that can be incorporated

into user-written programs.

Merlin is equipped to handle macros—prewritten routines that can be easily inserted into assembly language programs—and has linking capabilities that enable the user to write programs ordinarily too long to fit into a Commodore 64's memory. And *Merlin* can be used in an 80-column format on a computer equipped with a high-resolution monitor and an 80-column card.

THE PANTHER C-64 ASSEMBLER

The *Panther C-64 Assembler* is even easier to use than *Merlin*—so it's a popular package, especially among newer assembly language programmers. But it lacks some features that have become almost standard in assemblers—macro capabilities, for example—and for some reason, the displays and the programs listings it creates are always printed in lower-case letters, a feature I find annoying. Furthermore, the *Panther* consumes more memory space than either the *Commodore 64 Assembler* or *Merlin 64*, and some of the memory space the assembler eats up is in blocks of RAM which I feel should be left free for user-written programs.

On the positive side, the *Panther* is a joy to use; everything that it can do is directly accessible from the editor (a costly feature in terms of memory), and its assembly language editor has a beautifully engineered error-checking system that makes it almost impossible to write a bad line of code. And the instruction manual that comes with the program is very good; in fact, if I didn't own a *Panther* assembler, I might be tempted to buy one just to get my hands on the tutorials in its manual.

GOLDILOCKS & THE 3 ASSEMBLERS

When I started writing this series of columns, it was difficult to decide whether to use the *Commodore 64 Assembler*, *Merlin* or the *Panther C-64*. So I picked one by the Goldilocks method. After much experimentation, I concluded that the *Commodore 64 Assembler* was too big, the *Panther* was too little, and the *Merlin 64* was just about right. So most of the programs you'll see in this column were created with *Merlin*. If you own some other kind of assembler, that's okay; with minor modifications, the programs in these columns will work with any assembler compatible with the Commodore 64. But

for consistency, they'll all be written on a *Merlin*—and the column you're reading now, a tutorial on assemblers, will focus on the *Merlin 64*.

And that brings us to our real topic: how to use an assembler (such as the *Merlin*) to write a Commodore 64 assembly language program.

USING THE MERLIN 64

Merlin 64 can be loaded and executed like any other disk-based program. When you've successfully booted *Merlin's* master disk, this menu will be displayed on your monitor screen:

```
C : Catalog
L : Load source
S : Save source
R : Read text file
W : Write text file
D : Drive change
E : Enter ED/ASM
O : Save object code
G : Run program
X : Disk command
Q : Quit
```

The choices on this menu can be used to instruct *Merlin* to do quite a few things—from loading and saving assembly language programs (choices "L" and "S") to listing the names of the files a disk ("C") to running a machine language program ("G"). You can even format disks, scratch files from disks, and perform numerous other disk-management functions by choosing "X".

To write an assembly language program, you have to pick menu choice "E". That will take *Merlin* out of its "executive" (menu) mode and put it into its editor-assembler mode, which can be used for both writing and assembling assembly language programs.

When you've made menu choice "E" and put *Merlin* into editor-assembler mode, the menu on your screen will disappear, and you'll see a ":" prompt at the top of your screen. After that prompt, type

A

—for "append." *Merlin* will display the number "1" on your screen. That "1" is an automatically generated line number, and as soon as it appears, you can start typing an assembly language program.

Let's pause for a word about line numbers. One *Merlin* feature that takes some getting used to is its automatically generating line numbers, beginning with number 1 and progressing in increments of 1. So you never have to type a line number when you're using the program. And when you add or delete lines, all affected line numbers will change automatically.

When *Merlin* generates and displays a line number, the number is always followed by a space and a flashing

cursor. If you have *Merlin* up and running now, and if that's what you see on your screen, type an asterisk—without any additional spaces in front of it. Line 1 of your program should then look like this:

```
1 *
```

Merlin will then advance automatically to Line No. 2. Following the numeral 2, again without any extra spacing, type

```
* ADDNRS
```

—and hit your RETURN key. Then, when *Merlin* advances to Line 3, type another asterisk.

This is what you should see on your screen now:

```
1 *
2 * ADDNRS
3 *
4
```

In a moment, we'll discuss what those lines mean. First, though, let's get a little more familiar with *Merlin*.

At Line 4, press your carriage return, and you'll see *Merlin's* ":" prompt again. Then you can type "A" (for ADD) again, and continue writing your program. Or if you prefer, you can type some other command: "L" for list, for example. This will list your program, in its entirety, on your screen.

Another command that can follow the ":" prompt is "D" for DELETE. You would type the letter "D" followed by the number of the line (or lines) you want to delete. Suppose you wanted to delete Lines 2 and 3 in the above listing. You would simply type

```
D2,3
```

after the ":" prompt. Try it! Then restore the lines you've deleted by using the "A" command.

Still another command that can be used after the ":" prompt is "I" (for INSERT). Type the letter "I" followed by the number of the line where you want your new line inserted. Suppose you wanted to insert another asterisk at Line 2 in the above program. You could simply hit your RETURN key to get a colon prompt, then type

```
I2
```

Try that, and you'll see *Merlin* respond with the number

```
2
```

Now type an asterisk, followed by two carriage returns. *Merlin* will display its ":" prompt again, and you can then type "L" for list. Then *Merlin* will list your program, and you'll see that another line containing an asterisk has indeed been inserted into your program, at Line 2.

Speaking of lines, you can now delete that extra asterisk you've just added to your program. Hit a carriage return to get a colon prompt and type "D2." Then you can type "L" for LIST, and you'll get a listing showing you that your program looks like this again:

```
1 *
2 * ADDNRS
3 *
4
```

That looks okay, so now you can continue typing until you've entered the following program into your computer:

```
1 *
2 * ADDNRS
3 *
4      ORG      $8000
5 ADDNRS  CLD
6          CLC

LISTING YOUR PROGRAM

When you've reached Line 12 in your ADDNRS program, hit your RETURN key. Then you can type either L or LIST, and the complete program will be listed on your screen. Then you can examine the program line by line.

Lines 1 through 3 of the ADDNRS program are *comments*. Line 2 explains what the program does, and lines 1 and 3 set off the explanatory line by printing asterisks followed by white space.

Line 4 is the origin line of the ADDNRS program. Every program written on *Merlin 64* must start with an origin line. When a computer runs a machine language program, the first thing it does is go to a predetermined memory location and look at the value stored at that address. So when you write an assembly language program, the first thing *you* have to do is tell your computer where to start looking for the program in its memory.

The origin directive looks like a simple line to write; but deciding where to start a program can be a difficult task. There are many blocks of memory in your computer that you can't use for assembly language programs because they're reserved for other uses—for example, to hold your computer's operating system, disk operating system and BASIC interpreter. The best way to learn your way around your Commodore's memory banks is to consult a lot of memory maps and write a lot of assembly language programs. But in the early stages, it will usually be safe to start your programs somewhere around memory location \$8000 (or 32768 in decimal notation).

Line 5 of the ADDNRS program contains the label ADDNRS and the assembly language instruction CLD.

Labels always occupy the *first field* (the column that follows the line-number column) in an assembly language programs. And labels are very important in Commodore 64 assembly language programs, since labels, not line numbers, are used to access routines.

The abbreviation CLD in Line 5 is a *mnemonic*, or assembly language instruction. Mnemonics always occupy the second field (after the line number) in assembly language programs. The mnemonic CLD, which means "clear decimal mode," is often used prior to arithmetical operations in Commodore 64 assembly language. Inside your computer's 6510 microprocessor, a status flag called the decimal flag can be cleared with the instruction CLD. When the decimal flag is cleared, the Commodore 64's 6510 chip carries out all arithmetical operations using binary numbers. If the decimal flag is not cleared prior to an arithmetical operation, the operation is carried out using binary-coded decimal (BCD) numbers, a subject that will be discussed in later columns.

In Line 6 of the ADDNRS program, the mnemonic CLC is used to clear another 6510 flag, called the carry flag. This flag, as explained last month, is affected by so many kinds of operations that it's good programming practice to clear it before every addition operation—and to *set* it before every subtraction operation, so that it can be used as a borrow.

Line 7 of the ADDNRS program—"LDA #2"—is a very

straightforward instruction. When two numbers are to be added in an assembly language program, one must be loaded into a special 6510 register called the accumulator. Then the second must be added to the number that has just been placed in the accumulator. The sum of the two numbers is then left in the accumulator.

In *Line 7* of the ADDNRS program, the instruction LDA #2 is used to load the literal number 2 in the accumulator. The "#" sign in front of the number 2 means that it's a literal number, not an address. If the instruction in *Line 7* were "LDA 2," the accumulator would be loaded with the contents of Memory Address 0002, not the number 2.

Line 8—"ADC #2"—adds the literal number 2 to the number in the accumulator (in this case, another 2). As mentioned, there is no 6510 assembly language instruction that means "add without carry." So the only way an addition operation can be performed without a carry is to clear the status register's carry flag and perform an "add with carry" operation.

Line 9—"STA \$02A7"—completes the addition operation in the ADDNRS program. This statement stores the contents of the accumulator in Memory Address \$02A7 (usually a safe spot for storing data). Note that the symbol "#" is not used before the operand (\$02A7), since in this case the operand is a memory address, not a literal number.

The mnemonic RTS, in *Line 10* of the ADDNRS program, means "Return from Subroutine." The instruction RTS has two main uses in assembly language. When used at the end of a subroutine, it works like the RETURN instruction in BASIC; it ends the subroutine and returns to the main body of a program, beginning at the line following the line in which the RTS instruction appears. But if used at the end of the main body of a program—as it is here—it ends the program. Usually, control of the computer then returns to whatever was in control before the program began—usually the Commodore 64's built-in BASIC interpreter.

ASSEMBLING AND SAVING YOUR PROGRAM

To assemble the ADDNRS program using *Merlin*, all that is necessary is to type the command ASM following the ":" prompt. *Merlin* will then ask you if you want to update your source-code file—with the current date, for example. If you don't want to do that, you can type "N" (for "no") and *Merlin* will assemble your source-code program—very rapidly!

After you've assembled a source-code listing into object code, you can save both your source-code and object-code listings to disk. Here's how:

First type "Q" (for QUIT) after the ":" prompt to get your assembler back into its "executive" (menu) mode.

Merlin's main menu will then reappear. You can then save your source code by selecting menu choice "S," and your object code by picking menu choice "O."

After you type "S" or "O," *Merlin* will ask you what you'd like to name your program. You don't have to add a suffix to indicate whether it's a source-code listing or an object code program; *Merlin* will automatically add an "S" to the name of a source code listing, or "O" to the name of an object code listing.

RUNNING AN ASSEMBLY LANGUAGE PROGRAM

Once an assembly language program has been assembled into machine language, it can be executed without an assembler. When you have ADDNRS program assembled and safely stored on a disk, you can turn your computer off, turn it on again, and type the command

```
LOAD "ADDNRS.O",8,1
```

(As you may know, the number "1" at the end of a "LOAD" command informs your computer that the program being loaded is in machine language, and must therefore be loaded starting at the address that was designated in the program's ORG line.)

When the ADDNRS.O program has been loaded into memory, you can run it by typing the command

```
SYS 32768
```

That line will instruct your computer to run the program that now begins at Memory Address 32768 (\$8000 in hexadecimal notation). And, since the ADDNRS.O program has just been loaded into memory starting at that address, the program that will now be executed is the ADDNRS program.

AND NOW FOR SOMETHING COMPLETELY DIFFERENT

Unfortunately, the ADDNRS program doesn't appear to do much when it is loaded into memory and executed. All it does is add a couple of numbers and place their sum into a certain memory location; and that isn't very exciting, since no keyboard inputs are requested, and nothing is displayed on your computer screen.

So, in the listing on page 96, I've provided something to tide you over until next month's column. It's considerably more interesting than the ADDNRS program, and it will give you some practice in typing, assembling, saving and running assembly language programs. Type the *Flash* program on page 96, assemble it, and save it on a disk. Then run it, and watch the action. We'll discuss how it works in next month's column. □

Next month: *Addressing the Commodore, Part I*—the first of two columns that will explain the 13 addressing modes used in Commodore 64 assembly language programming, including several short illustrative programs.

COMMODARIES

PROGRAMMING CHALLENGES

By Dale Rupert

Each month, we'll present several challenges designed to stimulate your synapses and toggle the bits in your cerebral random access memory. We invite you to send your solutions to:

Commodares c/o Ahoy!
P.O. Box 723
Bethel, CT 06801

We will print and discuss the cleverest, simplest, shortest, most interesting and/or most unusual solutions. Be sure to identify the *name* and *number* of the problems you are solving. Also show sample runs if possible, where appropriate. Programs on diskette are welcome, but they must be accompanied by listings. Also tell what makes your solutions unique or interesting, if they are. You must enclose a stamped, self-addressed envelope if you want any of your materials returned.

Your original programming problems, suggestions and ideas are equally welcome! The best ones will become *Commodares*.

Problem #19-1: Binary Palindrome

Write a program to determine whether the binary equivalent of any input decimal number between 0 and 255 is a palindrome or not. Just one catch. Your program must *not* calculate the binary equivalent of the given number. (The eight-bit binary number must read the same forward or backward to be a palindrome.)

Problem #19-2: Memory Locator

This program does nothing more than tell where it is located in memory with an output such as this:

Program Text : AAA - BBB
Numeric Variables : CCC - DDD
Arrays : EEE - FFF
String Storage : GGG - HHH

where for example AAA and BBB are the starting and ending memory addresses of the program's text.

This is an easy problem if you know how to do it. Then again, aren't they all?

Problem #19-3: Orthogonal Time

At 3 o'clock and 9 o'clock the hands of the clock form a ninety degree angle. At what other times do the hands form a right angle?

If you are tempted to say 12:15, consider the fact that the hour hand has moved by the time the minute hand gets to the three. Your program should list all the times to the nearest second at which the hands of a clock are ninety degrees apart. If you submit your program, also send the answers it gives.

Problem #19-4: Screen Scramble

Jesus Geliga-Torres (Aguadilla, PR) suggested the following *Commodore*. Write a program which takes whatever is on the screen and rewrites it in a top to bottom, right to left fashion. The top row of the screen becomes the right hand column. Whatever was in the upper left corner is now in the upper right corner. The contents of the lower left corner will now be in the upper left corner. This should work for any text or text-mode graphics on the screen. !nuf ekil sdnuoS

First we will discuss a solution to last month's *Problem #18-1: Cycling Function* from Jim Speers (Niles, MI), then we will look at other readers' solutions to *Commodares* from the March issue of *Ahoy!*

Jim's solution to the problem he submitted is as follows:

```
10 DEF FNC(D)=D - 2*5*(X=0) + 2*5*(X=100)
)
```

When this statement is combined with the statements given last month

```
20 D=5 : X=0
30 PRINT X : X=X+D : D=FNC(D) : GOTO 30
```

the output cycles back and forth from 0 to 100 in steps of five. Line 10 is written so that you may replace the fives with any other step size you desire. Line 20 should be modified accordingly. Also you must be sure that the test values in line 10 (0 and 100) are reached exactly. If not, the output doesn't cycle. You might change the "=" to "<=" and ">=" if you are sure whether the endpoints will be reached exactly.

Here are two more general cycling functions which Jim suggested:

```
10 FNU(V) = V - S*(V<MX) + (MX-MN)*(V=MX)
)
```

```
15 FND(W) = W + S*(W>MN) - (MX-MN)*(W=MN)
```

MN, MX, and S are the minimum value, maximum value, and step size. FNU repeatedly cycles up from the minimum to the maximum value and then drops back to the minimum value to start over. FND does just the opposite. Add line 5 and change lines 20 and 30 as follows to see how these functions work:

```
5 MN=45 : MX=99 : S=3
```

```
20 X=MN : Y=MX
```

```
30 PRINT X,Y : X=FNU(X) : Y=FND(Y) : GO TO 30
```

Again, the endpoints must be reached exactly with the chosen step size.

Problem #15-1: Fancy Functions brought many responses. Readers used two significantly different methods to check for the "evenness" of a number as typified by these function definitions:

```
FNA(X) = -(X/2 = INT(X/2))
```

```
FNA(X) = 1 - (X AND 1)
```

The first uses a logical expression having a value -1 when true and 0 when false. The minus sign in front produces the desired result that FNA(X) equals 1 when X is even and 0 when X is odd. The second uses a Boolean expression which depends on the fact that the least significant bit in the binary representation of an even number is 0 and of an odd number is 1. (X AND 1) equals 1 for odd values of X and 0 for even values of X. Refer to the *Commodore 64 Programmer's Reference Guide* for a discussion of the AND operator.

A solution to the equilateral triangle area function is

```
FNB(X) = X*X*SQR(3)/4
```

or some variation on this theme.

There was not much need for originality for the random number generator function. Most solutions looked essentially like this:

```
FNC(X) = INT(X*RND(1)+1)
```

where FNC has a random integer value from 1 to X inclusive.

The fourth function as defined by most readers was of the form

```
FND(X) = INT(N*10^X + .5)/10^X
```

This rounds the number N properly to X decimal places, but only if X is positive. A more general solution handles

negative numbers as well:

```
FND(X) = SGN(X)*INT(ABS(N)*10^X+.5)/10^X
```

Glenn D. Elliot (Rutherford, NJ) used string functions to arrive at his solution:

```
FND(X) = VAL(LEFT$(STR$(N+5/10^(X+1)),LEN(STR$(INT(N))+X+1))
```

Unfortunately, this doesn't work properly for values of N less than 1. Can someone fix it up? How about a function that returns a value with X significant figures? For example, if N=1.254 and X=2, the result is 1.3, or if N=1254 and X=2, the result is 1300 or 1.3E3. Anyone up for the challenge? The string approach might be the way to go.

Several readers overlooked the requirement for *Problem #15-2: Prime Factors* that the solution contain only one statement per line. It is surprising how the inability to put more than one statement per line can complicate a program, especially with IF-THEN statements. The solution from John Prager (Bay City, MI) printed below is representative of most of the other proper solutions.

```
10 REM SOLUTION TO PROBLEM #15-2 :
20 REM PRIME FACTORS
30 REM BY JOHN PRAGER
100 INPUT N
110 FOR F=2 TO SQR(N)+.9
120 IF INT(N/F)=N/F THEN 150
130 NEXT F
140 F=N
150 IF A THEN PRINT"*";
160 PRINT F;
170 A=-1
180 N=N/F
190 IF N>1 THEN 110
```

John used the fact that you don't have to check for any factors larger than the square root of the given number. Any non-prime non-square number can be factored into factors, one of which is larger and the other of which is smaller than the square root of the number. Once you've found the smaller factor, division gives the larger. One way to speed this program up is to check only for odd factors once all factors of two have been divided up. The solution from Dana Rousseau (Memphis, TN) below takes that approach.

```
1 REM SOLUTION TO PROBLEM #15-2 :
2 REM PRIME FACTORS
3 REM BY DANA ROUSSEAU
4 REM (( SIMON'S BASIC ))
10 INPUT N
20 K=2
30 L=N-K*INT(N/K)
40 IF L=0 THEN PRINT K;"*";
```

50 IF L=0 THEN N=N/K
60 IF K*L>2 THEN K=K+2: ELSE :K=K+L
70 IF K*K<=N THEN 30
80 PRINT N

```

Dana used *Simons' BASIC*, which allows the IF-THEN-ELSE statement. You can delete the ELSE part of line 60 and add line 65 IF $K*L \leq 2$ THEN $K=K+L$ if you don't use *Simons' BASIC*. According to Dana, line 60 (i) does not increment K if K divides N (so it can be tried again), (ii) increments by 1 if $K=2$ and N is odd, and (iii) increments by 2 if $K>2$ and K does not divide N.

Jim Speers (Niles, MI) said that his solution found the prime number 999,999,937 (the largest prime number with fewer than ten digits) in just under 38 minutes. How do your times compare?

Congratulations to Brad Cameron (Metcalf, ONT), Daniel Knight (Grand Rapids, MI), David Alan Wright (New Britain, CT), Fred Atiyeh (Livonia, MI) and James Borden (Carlisle, PA) for their solutions to this problem.

There were two types of solutions to *Problem #15-3: Separated Sentence*, those that are printable on a printer and those that aren't. Those that aren't printable use the [UP] and [DOWN] statements to move the cursor between characters. A printer is a sequential access device whereas the screen (or a plotter) is random access. A one-liner from Tom Nielsen (Bismarck, ND) is listed below. It is for a random access output.

```

1 REM SOLUTION TO PROBLEM #15-3 :
2 REM   SEPARATED SENTENCE
3 REM   BY TOM NIELSEN
4 REM
10 INPUTB$:FORI=1TOLEN(B$)STEP2:PRINTMID
$(B$,I,1)""MID$(B$,I+1,1)"";:NEXT:PRINT"
"

```

Of the solutions which are hard-copy printable, some stepped through the input string twice, printing every other letter on one line, then dropping to the next line to print the rest. An example of this method is the program listed here from Marcus F. Cooper (Mililani, HI).

```

1 REM SOLUTION TO PROBLEM #15-3 :
2 REM   SEPARATED SENTENCE
3 REM   BY MARCUS F. COOPER, JR.
4 REM

$(S$,U,1)+"";:NEXT
20 PRINT:FORL=2TOLEN(S$)STEP2:PRINT" "+M
ID$(S$,L,1);:NEXT

```

Other readers created separate strings and printed them individually, as shown by this solution from Larry E. Cox (Tecumseh, MI).

```

1 REM SOLUTION TO PROBLEM #15-3 :
2 REM   SEPARATED SENTENCE

```

```

3 REM   BY LARRY E. COX
4 REM

30 B$=B$+MID$(A$,X,1)+CHR$(32):C$=C$+CHR
$(32)+MID$(A$,Y,1):NEXT
40 PRINTB$:PRINTC$

```

Daniel Knight (Grand Rapids, MI) suggested that you might encode a message with dummy letters this way, then write a program to decode it. The third type of solution above is probably the most useful if you want to utilize this concept in cryptography.

Problem #15-4: String Stretcher was meant to revive a classic geometry problem. Even after seeing a proof of the solution, it is still a bit difficult to believe the results. If the string is one yard longer than the circumference of a planet (any planet), the string could be placed around the planet at a uniform height of $1/(2*\pi)$ yards above its surface.

To see this, let C1 be the circumference of the planet. The length of the string is then C1 plus one yard. The radius of the planet is $C1/(2*\pi)$ and the radius of the string is $(C1+1)/(2*\pi)$. Some algebraic manipulations show that the difference in the two radii is simply $1/(2*\pi)$, independent of C1. Therefore the string will be approximately six inches (0.16 yards) above the surface regardless of the size of the planet.

A few readers resorted to some craftiness by putting delay loops into their solutions so it looked like the computer really had to "think" about the solution before printing it. Of the readers who commented, all said they enjoyed this bit of trickery. Your comments as to whether or not you like a particular type of problem are always welcome.

PROGRAM LISTINGS

Attention new Ahoy! readers! You must read the following information very carefully prior to typing in programs listed in Ahoy! Certain Commodore characters, commands, and strings of characters and commands will appear in a special format. Follow the instructions and listing guide on this page.

On the following pages you'll find several programs that you can enter on your Commodore computer. But before doing so, read this entire page carefully.

To insure clear reproductions, *Ahoy!*'s program listings are generated on a daisy wheel printer, incapable of printing the commands and graphic characters used in Commodore programs. These are therefore represented by various codes enclosed in brackets []. For example: the SHIFT CLR/HOME command is represented onscreen by a heart . The code we use in our listings is [CLEAR]. The chart below lists all such codes which you'll encounter in our listings, except for one other special case.

The other special case is the COMMODORE and SHIFT characters. On the front of most keys are two symbols. The symbol on the left is obtained by pressing that key while holding down the COMMODORE key; the symbol on the right, by pressing that key while holding down the SHIFT key. COMMODORE and SHIFT characters are represented in our listings by a lower-case "s" or "c" followed by the symbol of the key you must hit. COMMODORE J, for example, is represented by [c J],

and SHIFT J by [s J].

Additionally, any character that occurs more than two times in a row will be displayed by a coded listing. For example, [3 "[LEFT]"] would be 3 CuRSoR left commands in a row, [5 "[s EP]"] would be 5 SHIFTEd English Pounds, and so on. Multiple blank spaces will be noted in similar fashion: e.g., 22 spaces as [22 " "].

Sometimes you'll find a program line that's too long for the computer to accept (C-64 lines are a maximum of 80 characters, or 2 screen lines long; VIC 20 lines, a maximum of 88 characters, or 4 screen lines). To enter these lines, refer to the *BASIC Command Abbreviations Appendix* in your User Manual.

On the next page you'll find our *Bug Repellent* programs for the VIC 20 and C-64. The version appropriate for your machine will help you proofread our programs after you type them. (Please note: the *Bug Repellent* line codes that follow each program line, in the whited-out area, should *not* be typed in. See the instructions preceding each program.)

Also on the following page you will find *Flankspeed*, our ML entry program, and instructions on its use. ☐

BUG REPELLENT

This program will let you debug any *Ahoy!* program. Follow instructions for VIC 20 (cassette or disk) or C-64.

By Michael Kleinert and David Barron

For cassette: type in and save the *Bug Repellent* program, then type RUN 63000[RETURN]SYS 828[RETURN]. If you typed the program properly, it will generate a set of two-letter line codes that will match those listed to the right of the respective program lines.

Once you've got a working *Bug Repellent*, type in the program you wish to check. Save it and type the RUN and SYS commands listed above once again, then compare the line codes generated to those listed in the magazine. If you spot a discrepancy, a typing error exists in that line. Important: you must use exactly the same spacing as the program in the magazine. Due to memory limitations on the VIC, the VIC *Bug Repellent* will register an error if your spacing varies from what's printed.

You may type SYS 828 as many times as you wish, but if you use the cassette for anything, type RUN 63000 to restore the *Repellent*.

When your program has been disinfected you may delete all lines from 63000 on. (Be sure the program you type doesn't include lines above 63000!)

For disk: enter *Bug Repellent*, save it, and type RUN:NEW [RETURN]. Type in the program you wish to check, then SYS 828.

To pause the line codes listing, press SHIFT.

To send the list to the printer type OPEN 4,4:CMD 4:SYS 828[RETURN]. When the cursor comes back, type PRINT#4:CLOSE 4[RETURN].

Type in, SAVE, and RUN the *Bug Repellent*. Type NEW, then type in or LOAD the *Ahoy!* program you wish to check. When that's done, SAVE your program (don't RUN it!) and type SYS 49152 [RETURN].

To pause the listing depress and hold the SHIFT key.

Compare the codes your machine generates to the codes listed to the right of the respective program lines. If you spot a difference, an error exists in that line. Jot down the number of lines where

contradictions occur, LIST each line, spot the errors, and correct them.

FLANKSPEED FOR THE C-64

By Gordon F. Wheat

Flankspeed will allow you to enter machine language *Ahoy!* programs without any mistakes. Once you have typed the program in, save it for future use. While entering an ML program with *Flankspeed* there is no need to enter spaces or hit the carriage return. This is all done automatically. If you make an error in a line a bell will ring and you will be asked to enter it again. To LOAD in a program Saved with *Flankspeed* use LOAD "name",1,1 for tape, or LOAD "name",8,1 for disk. The function keys may be used after the starting and ending addresses have been entered.

f1 - SAVES what you have entered so far.
f3 - LOADS in a program worked on previously.

f5—To continue on a line you stopped on after LOADING in the previously saved work.

17—Scans through the program to locate a particular line, or to find out where you stopped the last time you entered the program. 17 temporarily freezes the output as well.

removing the RS232 card since I will interchange the computers with the same printer) with a C-64. Is there a hardware product to do this, preferably one with few or no software commands?

—Todd Walton
Vicksburg, MS

You need an RS232 interface for your Commodore. This is a relatively inexpensive device that can be easily found at most stores that handle Commodore products. In general there are two different types of interfaces: terminal type and printer type. You need the printer type. You may then use the printer as any other one by simply changing one number when opening the printer channel for output.

Mach 5 is a collection of powerful programs that enhance the capabilities of the C-64 with a 30 disk drive. The package provides up to 500% faster program loading and additional basic workspace and disk cataloging.

Mach 5 Loader will load 95% of all programs up to 500% faster than a normal 1541 disk drive. Add additional "single keystroke" commands to make life with your 1541 more pleasant. Mach 5 Base modifies the C-64 kernel and base ROMs to free up an additional 4K bytes of memory for use by basic language programmers. The workspace is increased from 39K to 43K while remaining fully compatible with normal C8M version 2 base and Mach 5 Loader.

Mach 5 Disk Organizer is a comprehensive disk management program which will create a disk containing directory information from the user's entire disk library. Disk names, file names and other information is automatically extracted from a disk and cataloged for future reference. The user can then obtain a sorted list of all disks and all files within the library, or search for specific file names or parts of names. Output can be directed to either screen or printer.
